Silence on clinical fundamentals

Your point about lifesaving hand washing to prevent diarrhoeal illness\(^1\) is well made. I have found that the attention you have noted to such clinical fundamentals in textbooks on sports medicine is mirrored by the absence of any notation, affirmative or otherwise, in many textbooks on pain, correlating the symptom (pain) with the physical sign (tenderness), a rudimentary clinical examination of the validity of pain, according to my clinical training in Ireland, that could distinguish malingerers from a genuine complaint of pain, for example. Perhaps I have received a false impression but, if so, the utility of eliciting tenderness, a longstanding custom during physical examination, seems a mystery.

In November 2002, I attended a conference in Florida on prescribing addictive drugs. None of the purportedly expert presenters mentioned the issue spontaneously. When I collared one of them after his lecture and enquired specifically about the point, he claimed that chronic, non-malignant pain and tenderness are usually “dissociated”-that is, a patient can suffer chronic, non-malignant pain in the absence of tenderness of the painful part, on physical examination. This assertion seemed contrary to my own, admittedly anecdotal, experience over some 24 years. Furthermore, it would seem to (a) render chronic, non-malignant pain, and maybe all pain, unknowable and undetectable (except perhaps to the alleged sufferer, although nobody else can tell), (b) place the assessment of pain in the realm of “pathological science”; and (c) invalidate the very idea of regulation of narcotic drugs to ensure that the practitioner prescribe one only when it “corresponds to the ailment”.

The silence on the subject in the medical literature seemed anomalous. A Boolean PubMed search on the keywords “pain” and “tenderness” revealed no relevant articles. I examined all 114 textbooks on pain in the medical library of the University of Southern California (USC) and found two\(^2\) that addressed the issue.

Physical therapists contradicted the foregoing opinion:

Tenderness always occurs in chronic pain syndromes.\(^{p 86}\)

The only textbook I found that physicians had authored and that discussed the subject agreed.

If any doubt regarding the existence of pathologic basis for the pain patient’s complaint is present, the findings can be confirmed or discounted by repeated palpation, approaching the region from a different direction each time. If this is done while the patient is distracted evocation of pain in the same region is some indication of a pathologic process.\(^{p 272}\)

Bonica thus suggests distracting the patient and approaching the painful area by stealth, presumably to prevent the patient from dissembling, but offers no references or other evidence based assessment of the efficacy of stealth and no expert opinion about any other best practices for considering tenderness. It would seem appropriate for authoritative references, which presumably promulgate best practice doctrine, consistently to hold tenderness to distinguish malingerers from sincere complaint of pain, or to be dissociated from pain, or to be otherwise equivocal and therefore to hold elicitation of tenderness to be a sacred cow that has no place in scientific medicine.

Some allege that British clinicians accord more value to physical diagnosis than do Americans, who reputedly rely too much on laboratory tests. The sample bias from predomiance, at USC, of American books on pain could explain my finding of widespread silence on the correlation of tenderness with pain. However, the only textbook I found at USC from the United Kingdom\(^3\) was likewise silent on the topic.

An amateur badminton player with juvenile dermatomyositis: courage and questions

Exercise is one of the prime ingredients of successful management of various muscle disorders. Without doubt, sport is an enjoyable way of exercising, and young patients in particular are very keen. However, for some patients, care and vigilance with regard to their disease and/or concurrent medical treatments is a prerequisite when exercise is prescribed. In this letter, we describe an amateur badminton player with juvenile dermatomyositis (JDM) and briefly consider the pros and cons of exercise therapy for such patients.

A 13-year-old boy presented with muscle pain in his right arm. The pain had first started 10 days previously, and occurred particularly during badminton training. It usually emerged in his right biceps and sometimes extended to the right elbow or shoulder. On detailed questioning, we discovered that he had concentrated on his “back-hand” during the preceding 10 days of training. He had had JDM for five years but was currently in remission. He was using prednisolone (7.5 mg/day), cyclosporine (100 mg/day), alendronate (10 mg/day), calcitonin, and vitamin D. Previously, he had also used various combinations of high dose steroids, methotrexate, and immunoglobulins. He had been an amateur badminton player for five years. His medical history was otherwise unremarkable.

The physical examination found tenderness on the medial side of the right biceps muscle. Elbow and shoulder motion were free and painless. The neurological examination was unremarkable except for a mild proximal weakness bilaterally. Ultrasonographic imaging was inconclusive. He was diagnosed as having a right biceps strain, caused by forceful backhand movements, and a conservative protocol was recommended including rest and intermittent cold application.

Patients with dermatomyositis may have many muscular complaints including proximal and symmetrical weakness, reduced endurance, and pain. Therefore it can have a major impact on physical function, limiting leisure and daily activities.\(^5\,6\) The predominant symptom of fatigue is presumed to be secondary to muscle or cardiopulmonary involvement, and deconditioning due to reduced activity and effects of medication. The perpetuating cycle of muscle atrophy, decreased body weight, corticosteroid myopathy, skeletal muscle microvesSEL disease, and abnormal energy metabolism usually culminates in a sedentary lifestyle with decreased aerobic capacity.\(^5\,6\) As children are known to do more walking and running than adults, muscle anaerobiosis may contribute...
to the limitations in endurance activities in patients with JDM.

Controlled physical exercises in patients with inflammatory myopathy have been reported to be safe. These may include stationary cycling, step aerobics, walking, and strength exercises for weak muscles, along with prompt warming, cool down, and stretching exercises.** Besides considerably improving muscle strength, these regimens have been found to increase aerobic capacity and daily physical functions of patients with JDM, without any adverse effects on the disease activity, when compared with healthy controls.** However, as eccentric contractions are more closely associated with muscle damage and greater efflux of muscle enzymes into the circulation, training that consists of mainly concentric-type exercises is recommended for these patients.**

In this adolescent patient with JDM, we emphasise the positive effect of sport even though it was used to be feared that exercise could aggregate muscle inflammation. Although highlighting the role of timely exercise regimens in rehabilitation programmes, we draw attention to the necessity for medical supervision. Doctors should be alert to any complications from underlying musculoskeletal pathologies such as myopathy and decreased bone mineral density in these patients.

Orthopaedic sports medicine, 2nd edn.

Coming nine years after the first edition, the second edition of DeLee and Drez’s Orthopaedic sports medicine is an impressive tome to complement any bookshelf. Containing over 2600 pages, this text is at best a valuable resource for the sports medicine clinician. At worst, it is potentially a health hazard, as mishandling of either of the 4 kg volumes could deliver a significant midfoot injury to the inattentive reader!

The authors have made a noble attempt to deal with non-surgical issues such as nutrition for sports, sports pharmacology, sports psychology, the female athlete, and environmental stress. That this remains essentially an orthopaedic surgical text, however, is best illustrated by the fact that anterior cruciate ligament injury is covered over 70 pages whereas osteitis pubis is covered in less than one page.

The early chapters covering basic orthopaedic sciences are particularly well written and provide information that is both detailed and current. The orthopaedic chapters deal with different regions of the body in a piecemeal fashion. Each chapter contains sections on anatomy, biomechanics, and radiology relevant to that body region. These sections are excellent. The radiological discussions are well supported by medical imaging photographs. The brevity of the rehabilitation sections is the only disappointment with the orthopaedic chapters.

No publication of this scale can be all things to all readers. The non-orthopaedic chapters provide an informative introduction for surgeons wishing to familiarise themselves with non-surgical issues. These chapters, however, tend to be brief, lacking in detail and current references. They do not provide the depth of knowledge required for specialist sports medicine training or practice. For instance, the section on stretching is largely a recycled version of a previously published chapter (acknowledged by the authors). The section is poorly referenced and out of date (including the authors cross-reference to their own previously published work), the most recent reference dated 1988. There are glib assertions that stretching prevents injuries and provides skill enhancement, without any attempt to support such assertions with scientific evidence. There is no discussion of recent papers challenging the benefits of static stretching in asymptomatic individuals.

The strength is in the orthopaedic sciences. The weakness is in the non-orthopaedic chapters which tend to lack detail and current knowledge.

Counselling athletes: applying Reversal Theory

I really liked this book. Its clear, readable style, use of quotations, case studies, and interweaving of applied and academic content held my interest throughout. Reversal Theory (RT) is sometimes placed on the fringes of sport psychology, offering little practical application because of its structural phenomenology. Kerr’s book firmly quashes such criticism, illustrating RT’s structural phenomenology as central to its application as an interpretative framework for an eclectical range of consultancy approaches.

Kerr’s use of quotations and case studies from elite sport participants is the book’s main strength. Using these, he places an RT filter against sporting experience and describes and interprets what occurs. Another of the book’s strengths is its clear, logical progression. This may seem obvious, but I felt that Kerr skillfully led us through increasingly complex RT concepts and applications without recourse to involved academic discussion that would detract from the book’s applied focus.

The discussion points after each chapter offer opportunities to check one’s understanding and provide excellent stimuli for teaching based discussions. Possible responses would have been useful throughout the book, particularly later on, where issues became increasingly complex. I would also have welcomed greater detail on the consultant’s perspective in chapter 8, such as dealing with one’s metamotivational states and interactions with clients’ metamotivational experiences.

This book is interesting, engaging, and may inspire practitioners to integrate RT into existing practices. I would certainly purchase this book and recommend it to postgraduate students and trainee consultants in sport psychology, existing practitioners, and some athletes.

Professional qualifications: BASES Accredited for Scientific Support

Target audience of the book: postgraduate students, practitioners, and some athletes.

Author details: John Kerr is the world’s leading expert on the application of RT in sport and exercise settings. He has pioneered the investigation and application of this theory in this context and published extensively on the topic. Although clearly at the upper echelons of sport psychology, existing practitioners, and some students and trainee consultants in sport psychology, existing practitioners, and some athletes.

Statistics in clinical practice

This is a concise and well written introduction to statistical concepts for those reviewing, students, and clinicians who wish to be able to better interpret the statistical side of research papers. It is a very light book which has the advantage of not intimidating those readers who are fearful of statistics. These are the readers who would derive the most benefit. It does not provide enough information for most postgraduate authors of papers who need more detail about how to choose and perform the actual statistical tests. Sections that could be expanded are those on assessing confounding and bias in papers, which is an important skill for reviewers and readers even if they don’t need to write their own papers. Study examples and questions are included for most chapters, with an exception being the small section in the final chapter on bias, where a practical example of a biased study would have been particularly useful. I can recommend this book to anyone who should have an interest in statistics but who has previously avoided the topic out of fear. If you already have a comprehensive textbook on statistics that you have actually read, then you are unlikely to derive much benefit. That is unless you want a read to brush up on statistics on an airline flight and the other book would tip your baggage over the weight limit.

Medicare India

6–8 April 2004, New Delhi, India

This exhibition and conference will be held for the first time, following India’s ambitious “health for all” programme launched in 2002. Further details: Rob Grant, Kinex Log. 5 New Quebec Street, London W1H 7TD, UK; tel: +44 (0)207 723 8020; fax: +44 (0)207 723 8066; email: rob.grant@kinexlog.com; websites: www.medicare-expo.com and www.kinexlog.com

The 6th STMS World Congress on Medicine and Science in Tennis in conjunction with the LTA 2004 Sports Science, Sports Medicine and Performance Coaching Conference

Keynote speakers include Professor Per Renström (SWE), Professor Peter Jokl (USA), Professor Savio Woo (USA), Dr Carol Otis (USA), Dr Mark Safran (USA), Dr Bernt Kilcher (USA), Prof Bruce Elliott (AUS), and Professor Ron Maughan (UK).

Further details: Dr Michael Turner, The Lawn Tennis Association, The Queen’s Club,
BASEM Conference 2004
14–17 October 2004, Belfast, UK
Main themes: Overuse Sports Injuries and Musculoskeletal Injuries. Keynote speakers include: Chris Bradshaw, Medical Director, Olympic Park Medical Centre, Melbourne and Kim Bennell, Assistant Professor, School of Physiotherapy, Melbourne University.
Further details: fionnuala.sayers@greenpark.nhs.uk

1st World Congress on Sports Injury Prevention
23–25 June 2005, Oslo, Norway
This congress will provide the world’s leading sports medicine experts with an opportunity to present their work to an international audience made up of physicians, therapists, scientists, and coaches. The congress will present scientific information on sports injury epidemiology, risk factors, injury mechanisms and injury prevention methods with a multidisciplinary perspective. Panel discussions will conclude symposia in key areas providing recommendations to address the prevention issue in relation to particular injuries and sports.
Further details: Oslo Sports Trauma Research Centre and Department of Sports Medicine, University of Sport and Physical Education, Sognsveien 220, 0806 Oslo, Norway. Email: 2005congress@nih.no; website: www.ostrc.no

NOTES AND NEWS

Intercollegiate Academic Board of Sport and Exercise Medicine
Professor Donald Macleod has completed his four year term as Chairman of the Intercollegiate Academic Board of Sport and Exercise Medicine. Professor Charles Galasko has been elected by the IABSEM Board to replace him. Professor Macleod has also been replaced as the representative of the Royal College of Surgeons of Edinburgh on IABSEM by Professor Angus Wallace.

Winners of the annual BASEM Prizes
Dr Eileen Mackie (Clopidogrel inhibits platelet activation and exercise induced ischaemia in stable coronary artery disease) and Mrs Eleanor Curry (Role of exercise in multiple sclerosis) (joint winners). The poster prize was won by Dr Stuart Reid (Injury patterns and injury prevention strategies in the winter sports population attending the English medical centre in Val d’Isere).

Diploma in Sport and Exercise Medicine for Great Britain and Ireland
Details of the above examination can be found on the Royal College of Surgeons of Edinburgh Website at http://www.rcsed.ac.uk. Alternatively, applicants can write to: The Royal College of Surgeons of Edinburgh, Eligibilities Section, Careers Information Services, 3 Hill Place, Edinburgh, UK; tel: +44 (0)131 668 9222 or Mrs Yvonne Gilbert, Intercollegiate Academic Board for Sport and Exercise Medicine, Royal College of Surgeons of Edinburgh, Nicolson Street, Edinburgh EH8 9DW, UK; tel: +44 (0)131 527 3409; email: y.gilbert@rcsed.ac.uk

Intercollegiate Academic Board of Sport and Exercise Medicine Diploma Exam
The following were successful diplomates in the Intercollegiate Academic Board of Sport and Exercise Medicine Diploma Exam, the two exams held in 2001 and 2002:

- Dr Andrew I Adair
- Dr Abimola Afolabi
- Dr Sinead M Armstrong
- Dr Terence J R Babwah
- Dr Catriona E L Boyle
- Dr Susan J Brick
- Dr Lawrence J Conway
- Dr Alan J Dawson
- Mr Patrick D Dissmann
- Dr Niall WA Elliott
- Dr Christopher J Ellis
- Dr Roger K Goulds
- Dr Niall A Hogan
- Dr James R Hopkinson
- Mr Ananta K Jayanti
- Dr Michelle Jeffrey
- Mr S P Kale
- Dr Arun Kumar
- Dr Robert M MacFarlane
- Dr Kaushal C Malhan
- Dr Martin D McConaghy
- Dr Lisa A McConnell
- Dr Fergal T E McCourt
- Dr Ronan M McKevitt
- Dr Michael G McMullan
- Dr Steven R McNally
- Dr Paul J Moroney
- Dr Leonard D M Nokes
- Dr Nanda K G Pillai
- Dr Jonathan D Rees
- Dr Duncal A Reid
- Dr Cristyn C G Rhys-Dillon
- Dr Martin O Rochford
- Dr Hungerford A T Rowley
- Dr Shaun A Sexton
- Dr Jason E Smith
- Dr Aravindhan Suppiah
- Dr James A Thomas

For further information contact: Mrs Yvonne Gilbert, Administrative Secretary, Intercollegiate Academic Board of Sport and Exercise Medicine, Royal College of Surgeons of Edinburgh, Nicolson Street, Edinburgh EH8 9DW. Tel: +44 (0)131 527 3409; fax: +44 (0)131 527 3408; email: y.gilbert@rcsed.ac.uk

www.basem.co.uk
The British Association of Sport and Exercise Medicine has launched its new website—www.basem.co.uk. The site provides information about the educational opportunities in sport and exercise medicine and advice to those wishing to become involved in this area.

Interested in Sports Medicine? Gain a higher degree from Australia’s leading university
The Centre for Sports Medicine Research and Education is a multidisciplinary Centre located in the Faculty of Medicine, Dentistry and Health Sciences at the University of Melbourne, Australia. It combines world-class researchers and clinicians working in the area of sports medicine.

Research Higher Degrees
The Centre offers Doctor of Philosophy (PhD), Master of Sports Medicine, Master of Physiotherapy, Master of Science, and Doctor of Medicine degrees. These are available to graduates of health and medical science courses such as physical therapy, medicine and human movement.

Sports medicine at the University of New South Wales
Masters of Sports Medicine
You don’t have to leave your practice:

- Delivery by distance education
- Videos, CD-ROMs, and online learning
- All aspects of Sports Medicine covered
- Locally organised examinations
- Clinical training
- Certificate and Diploma courses also offered
