Coaches’ perspectives on implementing an evidence-informed injury prevention programme in junior community netball

N Saunders, L Otago, M Romiti, A Donaldson, P White, CF Finch

Objective For effective sports injury prevention, information is needed about the implementation context for interventions. This study describes coaches’ feedback on the implementation of an evidence-informed injury prevention programme in community junior netball using coaches’ perceptions and the RE–AIM framework.

Methods A lower-limb injury prevention programme (Down to Earth; D2E), for teaching safe-landing techniques, was delivered to 31 coaches from 31 junior community netball teams in a 1-h workshop. Coaches then delivered a 6-week programme at team training sessions starting in the week before the competition season commenced. 65% of coaches completed a feedback survey 17 weeks after they had delivered the programme.

Results Most (88%) coaches believed that D2E improved their players’ ability to perform correct landing techniques in games and that players had retained these improvements over the season. The majority (83%) indicated that an improvement in player athletic attributes was the greatest advantage of D2E, followed by a reduction in injury risk. Identified barriers to implementing D2E were running out of time and very young players finding the drills too difficult. Coaches reported that they needed more ideas for training drills that could be incorporated into their programmes and believed that their own coaching training did not adequately prepare them to implement an injury prevention programme.

Conclusions Although coaches believed that D2E was effective in developing correct landing techniques, some modifications are needed to make it more suitable for younger players and coach education by accreditation could be improved to support the implementation of injury prevention programmes.

To reduce injury rates or to modify risk factors associated with particular injury mechanisms, specific training programmes have been implemented. While such programmes currently exist, very few have been implemented with junior players of team sports for whom the rate and impact of injury is high. Given the importance of coaches in delivering training programmes and other safety initiatives to players, it is surprising that there have been few studies of their injury prevention practices, safety promotion attitudes and ongoing role in implementing injury prevention programmes. Although coaches may not always have direct access to the latest injury prevention research evidence to inform their coaching practices, they do support implementing specific training programmes that can improve both player performance and reduce the risk of injury.

Coaches play a key role in implementing game development strategies that prevent players being exposed to inappropriate injury risks as they progress through age levels of competition. However, a survey of 35 coaches in junior rugby union identified a clear need for further education about the mechanisms and early management of sports injury. Coach education within netball and soccer has recently been shown to be effective in helping to decrease the likelihood of injuries in community players. To our knowledge, however, the specific implementation issues of an injury prevention programme, from the perspective of coaches in junior sports, have not been published in the peer-review literature.

There has been recent interest in understanding the context in which sports injury prevention interventions are implemented in an effort to enhance the likelihood that they will be adopted and sustained by the target audience. One framework for investigating intervention effectiveness in the implementation context is RE–AIM. In the context of a training programme to lead players through specific exercises for injury prevention, the components of this framework translate to assessing the: cohort of coaches and players exposed to the programme (Reach); coaches’ opinions of the advantages of the programme (Effectiveness); coaches’ willingness to use the programme (Adoption); coaches’ ability to implement the programme and adapt it to suit the needs of the players (Implementation) and the likelihood that coaches would continue to implement the programme (Maintenance).

This study considers the implementation of a training intervention specifically designed to prevent lower-limb injuries in netball. Netball has a high incidence of lower-limb injuries with ankle and knee injuries accounting for 30–84% and 8–41% of all injuries in adults, respectively. Although fewer lower-limb injuries occur in junior players, the incidence of injuries from falls (35%) suggests that such injuries could be due to poor balance or a lack of other key movement skills. Incorrect landing is a frequent cause of lower-limb injury in netball and most of these injuries occur without direct contact with another player. This implies an underlying mechanism of intrinsic dysfunction in fundamental movement patterns that could be addressed through targeted training interventions.

This paper reports coaches’ perceptions of, and suggestions for, improving the implementation of an evidence-informed safe-landing techniques
particular the most relevant age group and skill level (figure 1).

When asked if players’ ability to perform correct landing techniques in games improved while completing D2E, 88% of coaches concurred. These coaches also believed that their players had retained these improvements throughout the season. The coaches’ responses to the perceived programme effectiveness in contributing to reducing the players’ risk of ankle and knee injuries ranged from extremely effective (17%), quite effective (54%), slightly effective (21%) to neither being effective or ineffective (8%).

In addition, coaches were asked specifically to indicate the advantages of players completing D2E. The majority nominated improvement in player athletic attributes, followed by reduced injury risk and learning correct landing techniques (table 2). Three barriers to implementing D2E (given by 45% of coaches) were running out of time (42%), players finding the drills too difficult (42%) and too many sets and repetitions for young players to complete (38%). The coaches reported modifying the programme drills to overcome these barriers by decreasing the number of sets and repetitions (60%) and making the drills easier (45%).

Most coaches indicated that they would use D2E with all ages and ability levels, although they identified U13, U15 and low-skilled players as those who would benefit most from the programme (figure 1).

D2E, Down to Earth.
The majority of coaches (92%) indicated that an information booklet is valuable in making it easier to implement D2E. Most suggested that specific coach training courses (71%) and including safe-landing exercises in all team training sessions (79%) would also improve implementation. A training manual/book was identified by 96% of coaches as an important additional resource for helping them to implement D2E. A D2E information kit (79%) and website (71%) were common suggestions for additional coach resources. Incorporating D2E training into existing coach training workshops (96%) and/or coaching accreditation courses (83%) were considered to be the best way to encourage coaches to use D2E.

Factors or circumstances that were identified as making D2E harder for coaches to implement are presented in Table 3. Most coaches (79%) indicated that they require help to develop or modify training drills to incorporate D2E into their training sessions. They also reported (42%) that their general coach training did not adequately prepare them to implement a safe-landing programme such as D2E. Other implementation barriers were related to the challenges of working with young players, including poor concentration and motivation levels (83%) and the perceived value of injury prevention programmes by junior players (71%).

Finally, coaches were invited to provide comments and ideas on how to improve the implementation of future injury prevention interventions. Comments included:

Congratulations… The earlier the better that we as coaches introduce ‘Down to earth’.

Fantastic concept. I have learnt a lot. My team enjoyed it. They were a team of limited skills and I think they got some benefit from it. They enjoyed it for the fun but found it hard to concentrate on the skills bit.

A number of comments indicated that D2E could be improved through the modification of repetitions and the degree of skill required for each exercise:

Have separate training booklets for juniors and more advanced booklets for older girls so they don’t get bored.

Well set up programme but struggled teaching to under 11s because they lost focus and became bored. Drills were either too repetitive or out of their depth for them complete but it is important to add safe landing techniques. Booklet well explained.

Other comments referred to different aspects of implementing the programme and how it could be better incorporated into player training sessions or brought into coaching culture. These comments demonstrate that, to be effective, D2E needs to be incorporated into regular training sessions, rather than as a stand-alone programme. Comments included:

D2E training needs to be incorporated into normal training sessions and be age/skill specific.

As many practical demonstrations and training workshops as possible… delivered by qualified personnel.

Finally, coaches were asked if they intended to use D2E in the future with players of the same age and playing level as those in their current team/s. The majority of coaches (88%) indicated that they would continue to implement D2E.

DISCUSSION

D2E has previously been shown to be efficacious in reducing risk factors associated with lower-limb injury.24 The reach of the current study expanded from the original efficacy study.25 Using coach training as a delivery platform; a key factor for effective translation of scientific evidence into practice,12 13 the capacity to reach a large number of junior community netball players that could not be reached otherwise was enhanced. In total, approximately half of junior players and coaches of junior players from the target age groups within an association were exposed to D2E.

Coaches’ perspectives about the effectiveness of D2E indicated that the majority believed that it was effective in teaching junior players correct landing techniques and reducing their lower-limb injury risk. It is important to acknowledge that this implies that coaches were observing landing techniques that better matched D2E information and subsequently injury risk was reduced. In their opinion, D2E was also effective in improving players’ athletic attributes and improving game-related skills, such as passing, catching and abiding by the stepping rule.

To maximise D2E programme adoption, the current implementation strategy aimed to empower and educate coaches in the principles of safe-landing technique training, using the D2E resource. The coaches were then expected to implement the programme with their players while noting any emerging challenges. Although coaches adopted the programme, they were more likely to consider D2E relevant for U13, U15 and less skilled players than the very young or more skilled, senior players. At times, the programme was found to be too difficult

D2E, Down to Earth.
and boring for the younger players. In contrast, there was the perception that older players lacked motivation and did not believe they needed to develop a safe-landing technique.

In support of existing research it seems that incorporating D2E into existing coaching workshops and/or accreditation courses would be the most appropriate way to encourage coaches to implement the programme. This would facilitate the dissemination of critical information about correct landing techniques, motor learning concepts and how to access resources, thereby addressing some of the barriers identified to facilitate the adoption of D2E.

The D2E booklet was considered an important resource to assist coaches to implement the programme, with indications that a website and information kit would further aid implementation. Coaches also felt that specific coach training within existing accreditation schemes would assist programme implementation. This finding reinforces coaches’ views that they need to acquire adequate knowledge to maximise their capacity to implement injury prevention strategies. Coaches also identified a range of barriers to the implementation of D2E including a lack of skills/not being trained properly in this aspect of coaching. While this finding supports the importance of developing the coach as the interface between efficacy and effectiveness in sports injury prevention, further investigation is required to ascertain the particular aspects of the programme for which coaches lacked skills and understanding.

The programme focuses on the control of single-leg landings that are common in netball and uses a progression of drills to develop the level of control required. The coaches identified how they adapted and modified D2E to facilitate implementation in their own specific coaching environment. Strategies included decreasing the number of sets and repetitions for exercises and making the exercises easier for younger players, although this was sometimes difficult for coaches to do. This highlights a problem with the translation of scientific evidence generated from the laboratory into a real-world environment. In the case of D2E, the adaptation and modification by coaches makes it difficult to know if the programme would still be effective if a different set of activities were implemented. A comparison of injury rates, however, between a cohort of players exposed to D2E and a matched control group could shed light on the effect of programme modification.

Player-related factors would also need to be addressed before further implementation of D2E. Player concentration and motivation levels, and their perceived value of injury prevention programmes, are key factors that would need consideration. Although our coaches heavily promoted this safe-landing programme, coaches reported that player perceptions of injury prevention were somewhat negative. Subsequently, the only reported disadvantage of implementing D2E was player boredom. Coaches believed that a wider range of drills and exercises, relevant to the skill/age level of players, would enable coaches to deliver D2E in a more enjoyable and game-like way. In addition, coaches believed that players would be engaging in injury prevention practice without consciously being aware of it. Alternatively, a performance-enhancing benefit has been identified by coaches and players as a factor that would be likely to enhance the adoption of an injury prevention programme. Future injury prevention intervention research, particularly in netball, should thus consider the context in which the programme is promoted.
they were willing to maintain programme implementation well into the future. It would be worthwhile to reassess the retention of coaches’ knowledge and beliefs of D2E principles with an extended follow-up (eg, into the next season).

A major strength of this study is the theoretical underpinning of the evaluation. The RE–AIM framework19 is a well recognised framework for effectiveness research, and this study is one of the few to address the final stages of the translating research into injury prevention practice framework16 by considering an injury prevention intervention within its intended implementation context. Although this study was restricted to one netball association, and on a relatively small sample of coaches, there is no reason to believe that the issues raised would be very different to those raised by junior coaches elsewhere.

In summary, the effectiveness of D2E has been structured and evaluated using the RE–AIM framework, by examining the perceptions of coaches at 17 weeks post-intervention. The programme reached a large proportion of the coaches and players who were targeted and coaches believed the programme to be effective in improving their players’ ability to perform correct landing techniques and improving players’ athletic attributes. Barriers towards the adoption and implementation of D2E were identified, as were potential strategies to overcome these to enhance our understanding of translating scientific evidence into practice within a junior sport community.
