LETTERS TO THE EDITOR

Club doctors and physiotherapists

EDITOR,—Waddington et al are to be congratulated on highlighting the need to provide the best available care to professional footballers. Their paper is, however, inherently biased, and that detract from the validity of their conclusions. For example, they have provided no evidence for their postulation that non-chartered physiotherapists are more vulnerable to threats to their clinical autonomy than their chartered counterparts.

Published quotations from the semistructured interviews are of an emotive nature, and the quoted questions posed by the inter-viewer are clearly leading. It is well recognised that responses in such interviews can be greatly influenced by the manner in which they are posed.

The authors make no comparison of methods used by chartered and non-chartered physiotherapists, and their outcomes. Similarly there has been no comparison between the performance of club doctors with or without postgraduate qualifications in sports medicine, and, moreover, no evidence produced of actual harm resulting. Indeed, in recent months in Scottish League football, the Dundee club doctor restored circulation to the foot of a player following a serious ankle injury, and the Dumbarton club doctor restarted the breathing of an apnoeic player.

In a recent survey of 15 players in a Scottish football club (unpublished work), 13 stated that they had been discouraged by the (non-chartered) physiotherapists and nine by the (non-specialist) club doctor from training or competing while injured, and none had been encouraged by either to return to playing before complete recovery. Indeed, 10 confessed to concealment of the true severity of injuries, perhaps reflecting the ethos at that particular club.

Care offered to professional footballers merits careful evaluation. However, this should be detailed, methodical, and independent of bias, such as that which can arise when studies are commissioned and funded by interested parties.

Club doctors and physiotherapists

EDITOR,—The article by Dr Waddington and others1 on the problems surrounding the appointment and qualifications of these personnel will come as no surprise to all who work with team sports in this country. It is a familiar story and the points raised are valid and in many aspects wholly desirable.

However, before it becomes established dogma that all club doctors must possess a postgraduate sports medicine qualification, may I raise a word in the defence of the generic GP. In doing so I confess freely to being a member of the one sport, one club breed described in the article, albeit in a different sport from Association Football.

What I believe a club and its players need from their medical advisor is immediate access to a medical opinion. The subject of the opinion is of course often sports injuries or sports related illness, but far from exclusively so. A local GP lives and works in the immediate vicinity of the club is ideally placed for this task, which can at times be very demanding, at least in the urgency of the request. Club managers always need to know yesterday about their players. Enthusiasm for the club can mitigate against the stresses of this demand which can often intrude into family life as well as work. Of course in providing that opinion, doctors must know their limitations, practising only within their competence and referring on appropriately for specialist opinion when required. But is this not part of a GP’s standard job description? I suspect that all club doctors have had the experience of appropriate specialist colleagues, including sports physicians, who are rapidly able to provide that second opinion when required. It is this ability to use one channel for all its medical needs that is so valued by a club and its players.

I believe that the limited horizons of one club and its players would soon bore many doctors who have taken the time and commitment necessary to complete a postgraduate sports medicine qualification. Equally, very few clubs have the resources to adequately remunerate someone who has taken such a step. Such doctors will not wish to practise their art in a wider environment for both intellectual and financial reasons.

This is not to say that the club doctor should ignore the need for further education in the field of sports medicine. All GPs should respond to their educational needs by attending courses and lectures in the appropriate area. There is plenty of excellent provision available. In my experience, clubs are sympathetic to and supportive of this need. Maybe in time there will be enough doctors with specialist qualification to supply the demand, but, at club level, it is always likely to be as an add on to an existing job and GPs are likely to fill the role. I believe that they can do it well and safely. Is the GP who runs the practice diabetic clinic any less valuable for lack of MRCGP?

The article raises other important issues about the tensions on a club doctor arising from his role as employee of the club and his patients, which are certainly very real and need careful handling. But this letter is just to sound a note of caution before the “essential requirement” or “qualifications” postgraduate qualification demanded by Michael Cullen’s Commentary is taken as received wisdom in the field.

Authors’ reply

We are pleased that our paper on the above subject has generated a lively discussion and in this context we welcome the letters from Rob Mackay and Claire Hay. Both letters raise issues to which we would like to respond.

Dr Mackay appears to accept most of our findings, and the central point of his letter is to “sound a note of caution” before a specialist qualification is required as an essential prerequisite for club doctors. In this regard, Dr Mackay’s “caution”, as he makes clear, is aimed more at Michael Cullen’s commentary on our paper than on the paper itself. In our own paper, we argued that possession of a specialist qualification (or the willingness to study for one) “should be specified as a desirable (although not, in the short term, essential) attribute of candidates for the post of club doctor.”

However, it is fair to say that, in the longer term, we would like to move towards a situation in which such a specialist qualification is regarded as essential. Our thinking in this regard is based on a view that is, we think, fairly generally accepted: when seeking any service, whether from a doctor, lawyer, or motor mechanic, it is better—other things being equal—to have that service provided by someone who is more, rather than less, well qualified.

We should emphasise that we do not disagree with Rob Mackay’s suggestion that a background in general practice is appropriate for a club doctor; what we argued in the paper was that it would be advantageous if the GP acting as club doctor also had an appropriate specialist qualification in sports medicine in much the same way that the crowd doctor in football is required to hold the Diploma in Intermediate Medical Care.

Rob Mackay does raise an important issue when he suggests that the club doctor who dealt only with the limited range of injuries and illness in a single club would be likely to find this insufficiently challenging intellectually. We agree. However, there are two rather different issues involved here. The first is whether a doctor has a specialist qualification; the second issue is whether his (occasionally her) appointment is full time. A full time appointment would indeed present a limited range of clinical problems and may well result in professional dissatisfaction, but we do not argue for full time appointments; rather we argue that those who are appointed (whether full time or part time) should be appropriately qualified. This is a rather different issue.

Claire Hay’s letter is much more critical of our research, suggesting that our paper is “inherently biased”. Before we respond to this general criticism, we would like to respond to the major point of her letter which points out that we make no comparisons of the methods used by chartered and non-chartered physiotherapists and their outcomes, nor do we compare the performance of club doctors who do and those who do not have, specialist qualifications. She is of course correct, although this is hardly a criticism of our paper, because we made no claim to making such direct comparisons of quality of care. The objects of our paper were clearly stated in the title—to examine the qualifications and methods of appointment of club doctors and physiotherapists and to raise some problems and issues relating thereto.

This we did. Claire Hay’s claim that uncatered physios and doctors without a specialist qualification can provide good quality care is wholly irrelevant, for we made no claim to the contrary. In so far as our paper is raising issues on quality of care issues, it does so only
Sailing and swimming

EDITOR—With regard to the excellence of the Australians in the last Olympics, a small riposte is required. We need to examine Darwinism to understand fully this concept. As you pointed out, the Aussies did exceptionally well in the water, but have yet to fully evolve and are still swimming. The Brits on the other hand are far ahead along the evolutionary scale and have realised that to get from one island to another you don’t need to swim, you can sail. And as for rugby (Union the proper code), I do believe the English beat them recently. The other code attempted a “world” cup recently but each side was made up of Australians and was starting to resemble the US’s version of a world series.
