LETTERS TO THE EDITOR

Rapid responses

If you have a burning desire to respond to a paper published in Br J Sports Med, why not make use of our “rapid response” option?

Log on to our website (www.bjsportmed.com), find the paper that interests you, click on “full text” and send your response by email by clicking on “E.Letters submit a response”.

Providing it isn’t libellous or obscene, it will be posted within seven days. You can retrieve it by clicking on “read eletters” on our homepage.

The editors will decide, as before, whether to also publish it in a future paper issue.

Impact of professionalism on injuries in rugby union

EDITOR,—We were concerned about the alarming increase in injury in Scottish rugby union football.1 In their article, Garraway et al report the results of a 1997–1998 survey of Scottish club players, which, when compared with the findings of a 1993–1994 survey, indicate a substantial increase in the incidence of injury. The authors attribute this increase to factors associated with the advent of professionalism in rugby union football.

Garraway et al consider a number of possible explanations for their findings and then conclude that “the factor that is most likely to have contributed to the increased burden of injury is the increased physical contact which accompanies professionalism.”2 We have no argument with this, but we are sceptical that professionalism is the only factor affecting injury risk. In particular, the authors fail to undertake such research!

Firstly, thanks to Humphries for his comments on our paper. We agree that our respondents may have overestimated the time they spent leading and bouldering in comparison with top roping, although this is the case, we should ask why. Bravado, perhaps wishing to appear bolder than they actually are, or memory error, seem the most likely explanations. Memory error, resulting in this case in misclassification bias, is a potent source of error in epidemiological studies, a bias to which our study is no less susceptible than others reliant on memory based replies.

If the misclassification is all in one direction—that is, some people stated that their most common activity was leading and bouldering in comparison with top roping, and no one made the opposite error—the true odds ratio for leading and bouldering in comparison with top roping would be lower than that which we found. We have not performed a sensitivity analysis to estimate the degree of misclassification that would reduce the coefficient of this variable to non-significance.

We have one further comment to make in relation to Humphries’ remarks about “committed” climbers. We have undertaken a sensitivity analysis to establish that almost all our respondents would be committed climbers. We hope that our paper will be read as a clarifying document that will allow other researchers to undertake further research in this area.

Proportions of activities in a climbing gym

EDITOR,—I refer to the paper on indoor rock climbing by Wright et al.3 Firstly, thanks to the authors for adding some valuable information to the under researched area of indoor climbing injuries (particularly given the popularity of this activity world wide).

While I have no doubt that many of your participants put leading or bouldering as the activity that they spent most time doing while in the gym, I would have significant doubts that that is actually the case, particularly in lower grade climbers. I suspect that the participants in the study may well have overestimated the amount of time they spent in each activity, and that an analysis of actual time spent would reveal more time spent on a top rope than any other activity. This is a possible explanation for the otherwise unexpected findings when looking at the “preferred activity” as a predictor of overuse injury.

I do agree with the idea that many “committed” climbers will spend more time bouldering and leading than the non-committed, but this should logically be a factor to some extent related to grades climbed, not independent of skill level.

Authors’ reply

Thanks to David Humphries for his comments on our paper. We agree that our respondents may have overestimated the time they spent leading and bouldering in comparison with top roping, although this is the case, we should ask why. Bravado, perhaps wishing to appear bolder than they actually are, or memory error, seem the most likely explanations. Memory error, resulting in this case in misclassification bias, is a potent source of error in epidemiological studies, a bias to which our study is no less susceptible than others reliant on memory based replies.

If the misclassification is all in one direction—that is, some people stated that their most common activity was leading and bouldering in comparison with top roping, and no one made the opposite error—the true odds ratio for leading and bouldering in comparison with top roping would be lower than that which we found. We have not performed a sensitivity analysis to estimate the degree of misclassification that would reduce the coefficient of this variable to non-significance.

We have one further comment to make in relation to Humphries’ remarks about “committed” climbers. We have undertaken a sensitivity analysis to establish that almost all our respondents would be “committed” climbers, but the word has a different sense here from the way Humphries has used it.

Sports doctors’ resuscitation skills

Editor,—I cannot resist the temptation to join the debate on sports doctors’ resuscitation skills.1 The study by Thompson et al2 suggested that there is a perceived need among sports specialists for first aid skills. However, I received no response to my letter concerning this which indirectly posed the question, “should doctors who attend aquatic sports be able to deal with a suspected cervical spine fracture and recover the casualty?” Obviously, that is the task of a lifeguard in the same way that first aid at non-aquatic events is the task for a first aider, but perhaps doctors should be competent first aiders and/or lifeguards. This was never in the medical school curriculum and perhaps that should change. At least, first aid training is part of sports medicine courses, but I would like to suggest that lifeguarding should also be included. I would also suggest that all doctors at aquatic events should hold the NPLQ, NBLQ, or at least bronze medal level and bronze cross of the RLSS or overseas equivalent.

Should the organisers of any sports medicine course want advice on this, they should contact the RLSS at River House, High St, Brom, Akester, Warwickshire B50 4HN, UK. I would be happy to help out but would make two stipulations: everyone on the course should feel obliged to join the RLSS and they should sponsor me for my next fund raising event for the RNLI.

BOOK REVIEWS

This is the best book on the marathon that I have ever read. It is composed of a series of chapters based on lectures delivered at a British Heart Foundation symposium on marathon medicine held in London in 2000. The content includes a wide range of disciplines: history, sociology, psychology, medicine, physiology, and more.

It is noted in the introduction that the reader will be treated to the views of a veritable galaxy of experts. This is no false claim.

What a pleasure it was to read this book—comprehensive, direct, accessible, and practicable are only a few relevant adjectives applicable to this text. It even kept me awake on a Sydney to London flight! Beautifully presented with clear figures, singular in its lack of waffle, and very well referenced, this is the ultimate guide to so many aspects of what many consider to be the greatest race. In addition to the wealth of information contained in the chapters proper, I quite appreciated the inclusion of short sections of discussion between conference attendees and the experts which were included at the conclusion of some chapters.

Having personally struggled through a number of these events, I especially looked for practical information. Will it kill me? Probably not. Will I live forever if I complete one? No. What should I drink and eat? What about altitude training? Why do I fatigue? The answers, or our best current knowledge, are all there.

This is an excellent book. I am half way through it on the second reading. I would buy it myself and recommend it to all of those who care for participants in, or who are interested in, endurance sport. It is suitable for sophisticated athletes and both students and practitioners of sports science and sports medicine.

“Well we have tried to strike a balance between being too academic on the one hand and competing with the pocket guides on high altitude emergencies on the other” proclaim Michael Ward, James Milledge, and John West, three internationally respected authors on the subject of high altitude medicine. Their third edition is an attractively covered book, its suprising weight giving suitable reference to this text. It even kept me awake on a Sydney to London flight! Beautifully presented with clear figures, singular in its lack of waffle, and very well referenced, this is the ultimate guide to so many aspects of what many consider to be the greatest race. In addition to the wealth of information contained in the chapters proper, I quite appreciated the inclusion of short sections of discussion between conference attendees and the experts which were included at the conclusion of some chapters.

KIERAN FALLON
Head, Department of Sports Medicine, Australian Institute of Sport, PO Box 176, Belconnen, ACT 2616, Australia
kieran.fallon@ausport.gov.au

I was excited when I saw this book as the five authors are all well known to me as prominent in their respective fields. Nicola Maffulli of Stoke on Trent via Aberdeen and Hong Kong is an orthopaedic surgeon with a special interest in children’s injuries, Kai Ming Chan from Hong Kong is a widely published orthopaedic surgeon, Rose McDonald has been prominent in sports physiotherapy in the United Kingdom for many years, Bob Malina from Michigan State University is one of the foremost experts in children’s growth, and Tony Parker has been a leading FIMS official for many years.

Their stated aim is “to address in one volume the specific problems of different categories of individuals in sport”. The four groups considered were the young, the old, the female athlete, and the disabled athlete—all important subgroups with specific problems of their own. These four groups usually get a chapter each in general sports medicine books, so one would hope that these areas would be considered in significantly more detail in this publication.

The children’s section covers all the important issues such as growth and maturation, strength and endurance training, nutrition, and competitive stress. The sections on injuries have some inaccuracies—for example, in the section on navicular stress fractures describing the pain as “well localised to the apex of the foot” and prescribing rest only in the treatment, and the use of a rigid Boston brace in all cases of spondylolysis—but they are generally well covered.

The female section also covers all the major issues but is quite repetitive, with three different chapters all covering menstrual irregularities. The sections on ageing and master athletes (surely that should be masters...

Clinical risk management is a strange subject which will perplex many readers. If this was a book about cricket, it would have chapters on no balls, wides, missed stumpings, and accuracies by Indian bookmakers, but it probably would not talk about how to become a successful cricketer. As a result, some readers will be a bit put off by both its lay out and content. However, for those who already practice high quality medicine, this text offers an opportunity to refine their practice further.

To a large extent, clinical risk management grew out of the need to address issues arising from litigation against individual doctors and health services—an influence that still strongly underpins this volume. A somewhat broader view, that there are inherent risks in all medical practice and we must learn how to deal with them appropriately, also strongly influences this book and represents the future of clinical risk management. This will not only reduce adverse events for patients, but will also have the pleasant side effect of reducing litigation.

The most interesting aspects of this book are those that apply the principles and issues of risk management to individual clinical disciplines. The reviews in areas such as oncology, psychiatry, and emergency medicine are well thought out and well referenced, providing useful information to enable clinicians to further reduce adverse events in their specialty and the consequences of those adverse events.

While not quite having reached Bible status, this book provides an extremely comprehensive introduction to the area of clinical risk management for the novice, and also would be highly useful as a reference for individuals seeking to know more about clinical risk management. While probably not quite making it to bedtime reading, it is a book where each chapter or area can be read in its own right. It is certainly a book that every clinical risk manager should have access to, and I would recommend that clinicians read their specific chapter. In future editions, this area of the book I am sure is destined for expansion.

12–15 May 2002, Montreal Convention Center, Montreal, Canada

The purpose of the conference is to bring together the stakeholders to facilitate exchange between sectors and disciplines; promote the sharing of knowledge and intervention models and encourage partnerships between the public and private sectors.

The conference will include plenary sessions on topics of concern to all professions (for example, the influence of the media on the safety of populations: the role of policies and laws) and state of the art presentations focusing on their respective fields. Simultaneous translation of all presentations and the opening and closing ceremonies will be available in French and Spanish. Additionally, as the focus is to facilitate exchange, parallel sessions (oral presentations, round tables, and debates) and poster sessions will be organised around six major themes: Road Safety, Occupational Safety, Sport, Leisure, Home, Institutional and Product Safety, Suicide Prevention, Violence Prevention and Post-trauma care and Rehabilitation.

NOTES AND NEWS

www.basesm.co.uk
The British Association of Sport and Exercise Medicine has launched its new website—www.basesm.co.uk. The site provides information on the educational opportunities in sport and exercise medicine, and advice to those wishing to be involved in this area. BASEM members can also access the latest information of BASEM events.

www.UKSI.net
The UK Sports Institute (UKSI) is currently developing a password restricted website—www.UKSI.net—for the elite professional sporting community including athletes, coaches, and those in sport science and medicine. The site will be commissioning experts to write articles on a variety of topics. Each article will be aimed at the entire audience, promoting the integrated philosophy of the UKSI.

Bayesian statistics and evidence based medicine
Evidence based medicine is the buzzword of the day. But in fact, the standard statistics that are used in almost all studies do not answer the questions that are of interest to the clinician, even though they are misinterpreted as if they do. A new website www.physio.mcgill.ca/smcourse/bayesian is now available that compares the inferences that can be drawn from standard statistics with those that can be drawn from the Bayesian statistical approach. The authors welcome all questions and comments. This site is designed for both clinicians and epidemiologists.
