The authors concluded that, in order to correct the atrophy observed in the lumbar multifidus, patients should strengthen in exercises targeting the lumbar extensors, ideally incorporating an isometric “pause” into these exercises. Danneels et al reported that this was the only exercise model tested that developed sufficient hypertrophy to correct the multifidus atrophy seen in their experimental population.

These findings conflict with those of Hides and colleagues, who have published data showing correction of the pathology-induced lumbar multifidus atrophy using a considerably more specific and subtle activation of the multifidus muscle. Unfortunately, the method by which the authors measured the cross sectional area (CSA) of the multifidus muscle introduced a large degree of methodological error, calling into question the study’s results and therefore its clinical recommendations. Using computed tomography scanning, Danneels et al took measurements from three arbitrary levels of the lumbar spine (the L3 superior end plate, the L4 superior end plate, and the L4 inferior end plate) recording the CSA of the multifidus muscle at each of these levels bilaterally. They then summed the right and left multifidus CSA at each of these segments resulting in a single multifidus score for each level.

In preselecting the levels from which CSA measurements would be taken, it is possible, indeed even likely, that the pathological level would have been missed entirely in at least some of the subjects. This is important because previous studies have shown that the multifidus muscle experiences its greatest loss of CSA at the primary level of pathology. Also problematic was the decision to sum the CSA scores at each of the preselected levels. A number of studies have shown that the lumbar multifidus, ipsilateral to the pathological side experiences no such changes. Taken together, the preselection of measurement levels and the summation of the bilateral multifidus CSA would have had the effect of attenuating any side to side differences in multifidus CSA even if a subject’s level of pathology happened to coincide with one of the levels from which measurements were obtained. Through either of these mechanisms, this measurement scheme would have introduced a substantial mass of healthy, non-motor dysfunctional muscle into each of the multifidus CSA measurements. The net effect of the measurement approach employed by Danneels et al, although probably intended to more discretely reflect the pathological side multifidus, was to confuse the outcome. The experimental intervention toward an exercise model with the ability to cause hypertrophy in healthy muscle—that is, a strengthening exercise. It is likely that the “dynamic-static” exercise recommended by the authors as being most effective for correcting the pathological atrophy of the multifidus instead caused hypertrophy of the non-pathological, non-atrophied multifidus muscle segments included in the three measurement scores. Ultimately, the study’s recommendations are unsupportable given this flaw in methodology.

The low load multifidus activation exercise, developed by Richardson et al and used by O’Sullivan and colleagues, is to be performed as a co-contraction with the transversus abdominis muscle, with the aim of correcting a neurologically mediated loss of normal multifidus muscle volume, not unlike that seen in the vastus medialis following trauma or surgery involving the knee joint. In studies in which the CSA of a pathological multifidus muscle has been compared with its contralateral and “healthy” segmental partner, this form of motor re-education exercise has been shown to normalise the CSA of the pathological multifidus in as little as four weeks. It is critical that both researchers and clinicians appreciate that a significant body of research now shows that the multifidus muscle in people with low back pain dysfunction is representative of a form of impaired motor control, not simple disuse weakness. As such, traditional strengthening exercises will often fail to correct this fault, just as daily physical activities fail to maintain a normal segmental CSA at the pathological level. Certainly, the historical lack of success of the rehabilitation and medical professions in treating low back pain using a variety of strength based clinical models used over the last 50 years should serve as sufficient motivation to look to more evidence based models as an explanation for the condition. The motor control dysfunction model as developed over the past decade by a variety of researchers holds great promise, both as a basis for understanding the causes of back pain and in developing more effective treatment strategies for our patients.

POSTSCRIPT

The event side doctor: the role of the orthopaedic surgeon

Orthopaedic surgeons have long had a close association with sport. International sporting players have similarly gone on to careers in orthopaedic surgery, examples being Jonathan Webb and JPR Williams.

With the need to find appropriate medical personnel to care for the needs of spectators and athletes at major sporting events is a challenge.1 Event organisers have required the skills of volunteer orthopaedic surgeons. I volunteered as a competitors’ doctor for the XVII Commonwealth Games in Manchester. As a specialist registrar in orthopaedics and holding an emergency medicine registrars post, I felt suitably skilled to be an event side doctor for the time trial, mountain biking, and road race events.

During the course of the events, I reviewed cyclists with dyspepsia and back strain. I also reviewed a camperan with hay fever and one with eye irritation possibly caused by an insect bite or allergy. Regarding true “orthopaedic bone problems”, a mountain biker presented with carpal injury, query fracture, and a mountain biking spectator with a fractured clavicle. With no x-ray facilities at the event centre, all I could do was provide immobilization, ice treatment, analgesia, and reassure, before referring on to a facility to provide definitive diagnosis and treatment.

Although I had a very enjoyable Games and gained greatly from the experience, I felt a little inexperienced in event side medical problems and that my occupational skills were under used because of event side facilities. The event side medical centre had adequate first aid and resuscitation equipment. Most problems could be treated by paramedics, a physiotherapist and a general practitioner trained in sports medicine.

Volunteers should appreciate that the event side doctor needs to have general rather than specialist skills.2 My position as an orthopaedic registrar clearly lies in the hospital setting with x-ray facilities and an operating theatre. I have not, however, been discouraged from volunteering for future events.

Increased endothelin-1 levels in athletes

Endothelin-1 (ET-1), a potential vasoconstrictor peptide, may contribute to the exercise induced redistribution of blood flow in muscles.3,4 On the other hand, the latter parameter in athletes may be expanded secondarily to muscle volume and as a consequence of increased ET-1 production.5 In this study, we found a difference in basal serum ET-1 levels between trained male athletes and normal matched male controls.

We studied 13 male professional football players (mean (SEM) age 27.8 (1.0) years; body mass index 24.2 (1.2), mean (SEM) body mass index 24.2 (1.2) kg/m²) and an equal number of sedentary or moderately physically active men (age 26 (1.3) years; body mass index 24.4 (1.8) kg/m²). All subjects gave written consent and had a normal family history of diabetes and hypertension. Blood samples were collected at 8 am after an overnight fast; all subjects remained at rest for 20 minutes in a supine position, before collection of the blood specimen. ET-1 concentration in serum was measured by radioimmunoassay (Peninsula Lab Inc, Belmont, California, USA). Data were analyzed by Student’s t test for independent samples.

The concentration of ET-1 in the serum was significantly higher in the athletes than control subjects (22.16 (0.87) vs 7.74 (0.29) pg/ml, p<0.001; values are mean (SEM)). Serum creatine kinase was also found to be significantly higher in athletes than controls (331.84 (43.3) vs 110.5 (17.3) U/L, p<0.001; values are mean (SEM)).

The increased creatine kinase levels may be attributed to the increased muscle mass in athletes, and the increased serum ET-1 levels can be explained as being a consequence of a widening of the vascular bed resulting from the increased muscle weight and size.

BOOK REVIEW

Reckoning with risk: learning to live with uncertainty

Gerd Gigerenzer has a passion for improving statistical numeracy which is rarely encountered in the normally dry statistics texts. He has researched and published extensively on how doctors and other professionals interpret risks and convey that information to their patients. He has also shown how clinicians’ understanding of risk can be improved dramatically by changing the way they process information about risk.

The early chapters of the book look at Gigerenzer’s research into clinicians’ understanding of statistics and Bayes’s rule, and shows just how poor senior clinicians’ understanding of risk is. He shows that similar problems exist in other professions as well. He indicates how confusing it can be for our patients when we try to convey our understanding of risks to them. There is a section devoted to how companies and researchers try to change our opinion, to their advantage, with statistics. He then proceeds to show a more intuitive way to deal with statistics. Gigerenzer’s methods are powerful tools for explaining to a patient the true nature of their risks.

This book has been written for the general public, but if you find risk statistics difficult to interpret and convey, then this book is definitely for you. It is written in a very instructive and well thought out style, and covers a diverse range of problems encountered in everyday as well as clinical life. I think it should be on the curriculum for all postgraduate medical courses.

Calendar of events

Skills Course in Musculoskeletal Ultrasound
6–8 January 2003, Oxford, UK
Further details: Alison Davies, Department of Radiology, Nuffield Orthopaedic Centre, Headington, Oxford, OX3 7LD, UK; tel: +44 (0)1865 227765; fax: +44(0)1865 227347; email: alison.davies@nsrc.nhs.uk

BASICS Refresher course
28–29 November 2002, Madingly Hall, Cambridge, UK
This two day course is directed at previous participants on the pre-hospital emergency care and immediate care courses. The aim is to maintain and update skills, incorporating the latest developments in pre-hospital care.
Athletes Heart Symposium
17 December 2002, University College London, UK
An international multidisciplinary symposium for physiologists, cardiologists, sports scientists, and physicians in association with the Physiological Society.
Further details: Lynn Coombs, Cardiac Department, Homerton University Hospital, Homerton Row, London E9 6SR, UK; email: ahsymp@binternet.com

3rd Québec International Symposium on Cardiopulmonary Rehabilitation Evidence Based Interventions: Science to the Art of Cardiopulmonary Rehabilitation
11–13 May 2003, Québec City Convention Center, Québec, Canada
Call for abstracts deadline is 1 November 2002. The abstract submission form and complete programme can be printed from the web site.
Further details: email: Jean JOBIN@med.ulaval.ca
Web site: www.ulaval.ca/symp-rehab

The 6th STMS World Congress on Medicine and Science in Tennis in conjunction with the LTA 2004 Sports Science, Sports Medicine and Performance Coaching Conference
Keynote speakers include Professor Per Rennstrom (SWE), Professor Peter Jokl (USA), Professor Savio Woo (USA), Dr Carol Otis (USA), Dr Mark Safran (USA), Dr Ben Kibler (USA), Prof Bruce Elliott (AUS), and Professor Ron Maughan (UK).
Further details: Dr Michael Turner, The Lawn Tennis Association, The Queen’s Club, London W14 9EG, UK; email: michael.turner@lta.org.uk

International XVIII Pujo Symposium
25–28 June 2003, Kuopio, Finland
This symposium “Physical activity and Health—Gender Differences Across the Lifespan”
Further details: Ms Auli Korhonen, Project Secretary, Kuopio Research Institute of Exercise Medicine, Pujo Symposium Secretariat, Haapaniementie 16, 70100 Kuopio, Finland; tel: +358 17 288 4422; fax: +358 17 288 4488; email: pujo.symposium@uku.fi

Sports Medicine Seminar at the Hong Kong Sevens
27 March 2003, Hong Kong
This will be the first of an annual conference on Sports Medicine to coincide with the premier 7s event. Please visit the website www.droid.cuhk.hk/events/sms.htm.
Further details: Iain Stewart, National Diagnostic Imaging, Woden, ACT 2606, Australia; tel: +61 2 6282 2888; email: ncdi@ozemail.com.au

NOTES AND NEWS

Winners of the annual BASEM Prizes
Dr Eileen Mackie (Clopidogrel inhibits platelet activation and exercise induced ischaemia in stable coronary artery disease) and Mrs Eleanor Curry (Role of exercise in multiple sclerosis) (joint winners).
The poster prize was won by Dr Stuart Reid (Brain stem and spinal cord injuries: a multidisciplinary approach to sports medicine) (joint winners).

Diploma in Sport and Exercise Medicine for Great Britain and Ireland
Details for the above exam can be found on the Royal College of Surgeons of Edinburgh Web site at www.rcsed.ac.uk alternative applicants can write to: The Royal College of Surgeons of Edinburgh, Eligibilities Section, Careers Information Services, 3 Hill Place, Edinburgh; tel: +44 (0)131 668 9222 or Mrs Yvonne Gilbert, Intercollegiate Academic Board for Sport and Exercise Medicine, Royal College of Surgeons of Edinburgh, Nicolson Street, Edinburgh EH8 9DW; tel: +44 (0)131 527 3409; email: ygilbert@rcsed.ac.uk

Intercollegiate Academic Board of Sport and Exercise Medicine Diploma Exam
The following were successful diplomates in the Intercollegiate Academic Board of Sport and Exercise Medicine Diploma Exam:

July 2000
- Dr Prabodh C Agarwal
- Dr Robert Bleakney
- Dr Trevor W Fleet

November 2000
- Dr James P Robson
- Dr Samantha L Fee
- Dr David C Watkins
- Dr RS Prabu

For further information contact: Donald AD Macleod, Chairman, Intercollegiate Academic Board of Sport and Exercise Medicine.

The British Association of Sport and Exercise Medicine has launched its new web site—www.basem.co.uk. The site provides information about the educational opportunities in sport and exercise medicine and advice to those wishing to become involved in this area.

Interested in Sports Medicine? Gain a higher degree from Australia’s leading university
The Centre for Sports Medicine Research and Education is a multidisciplinary Centre located in the Faculty of Medicine, Dentistry and Health Sciences at the University of Melbourne, Australia. It combines world-class researchers and clinicians working in the area of sports medicine.

Research Higher Degrees
The Centre offers Doctor of Philosophy (PhD), Master of Sports Medicine, Master of Physiotherapy, Master of Science, and Doctor of Medicine degrees. These are available to graduates of health and medical science courses such as physical therapy, medicine, and human movement.

Educational programme
The Centre offers a one month full time Post-graduate Certificate in Sports Physiotherapy: spine, pelvis, and lower limb. Instructors are leading clinical experts and researchers in the multidisciplinary approach to sports medicine. The Certificate will run from Nov 4–29 in 2002.

Please contact: Professor Peter Brukner: p.brukner@unimelb.edu.au (Research Degrees), Professor Kim Bennell: k.bennell@unimelb.edu.au (Research Degrees), Mr Henry Wajswelner: h.wajswelner@unimelb.edu.au (Certificate Courses), www.physio.unimelb.edu.au/csmre
Sports medicine at the University of New South Wales
Masters of Sports Medicine
You don’t have to leave your practice:
• Delivery by distance education
• Videos, CD-ROMs and online learning
• All aspects of Sports Medicine covered
• Locally organised examinations
• Clinical training
• Certificate and Diploma courses also offered

Further details: Sports Medicine Programs,
UNSW Sydney 2052, Australia; tel: +612 9385 2557; fax: +612 9313 8629; email:

NCPAD NEWS
A monthly publication of the National Center on Physical Activity and Disability. NCPAD is the leading source for information about organisations, programmes, and facilities nationwide providing accessible physical activity and recreation. NCPAD also has a large and growing online library of fact sheets, monographs, and contact information on physical activity and recreation for people with disabilities.

Sign up for this free monthly electronic newsletter by sending an email to: Listserv@listserv.uic.edu, with this message in the body of the email: SUBSCRIBE NCPAD-NEWS yourfirstname yourlastname. If you have any difficulty, you can also sign up for the newsletter by going to www.ncpad.org/signup

Study Sports Physiotherapy in Australia’s sporting capital at The University of Melbourne
Qualified physiotherapists may now apply for the Master of Physiotherapy by Coursework (Sports Physiotherapy), the Postgraduate Certificate in Physiotherapy (Sports Physiotherapy of the Spine, Pelvis and Lower Limb) or the Postgraduate Certificate in Physiotherapy (Sports Physiotherapy of the Spine, Shoulder and Upper Limb). The School of Physiotherapy at the University of Melbourne now has approval for these courses and applications are open to international students for full time study.

• Applications for the Master of Physiotherapy by Coursework (Sports Physiotherapy) close 1 October 2002.
• Applications for the Postgraduate Certificate in Physiotherapy (Sports Physiotherapy of the Spine, Pelvis and Lower Limb) close 1 November 2002.
• Applications for the Postgraduate Certificate in Physiotherapy (Sports Physiotherapy of the Spine, Shoulder and Upper Limb) close 1 April 2003.

Please check the website for updates and information about the courses: www.physioth.unimelb.edu.au/postgrad.html
