

Supplementary figure 4 Running participation and all-cause mortality risk: a sensitivity meta-analysis including HRs from an alternative model in Lee et al. (2014) study and from Stamatakis et al. (2017) study

A description of the model from the Lee et al. (2014) study can be found in online supplementary table 1 (Model 2); HR=adjusted hazard ratio (the list of variables that were adjusted for in each study is available in online supplementary table 1); 95% CI=95% confidence interval for HR; RE Model=pooled effect size from a random-effects meta-analysis model; p -value for the pooled HR <0.001; Heterogeneity $I^2 = 0.01\%$ ($p = 0.271$)
