Evidence on the relevance and dissemination of these statements is important for the development of future statements.

Objective The objective of this project was to investigate the relevance and dissemination of the IOC consensus statements among sports medicine professionals directly involved in Olympic athlete health in a developing setting (South Africa).

Design Qualitative case study.

Methods Semi-structured interviews, document analysis and field-notes were utilised. Seven sports medicine professionals interviewed.

Results Awareness around consensus statement topics and perceived access to the statements was limited in South Africa, especially for clinicians who are not currently active within an academic or research setting. In terms of relevance, participants described the importance of practical relevance of the statements, emphasizing the need for inclusion of the athlete's voice and diversity in skills, experience and context of the consensus statement authors. Participants also described the need to align format and content of the information according to the target audience. The usability and utilisation of the statements were determined by the perception of relevance at the time, within the specific context, as well as the ability to provide a practical message. Healthcare inequities, poorly resourced national federations, as well as general resource and time restrictions when managing athletes (reactive versus proactive management) were also considered as barriers to utilisation.

Conclusions The statements were perceived by South African sports medicine professionals as being relevant and beneficial for the management of athlete health. However, issues around awareness, access, usability, and practical application in a developing country were also raised.

10.1136/bjsports-2021-IOC.346

Background The IOC Medical and Scientific commission's mission is to provide a guiding reference for sports organisations on issues relating to the protection of the health of athletes. One strategy to achieve this mission is through supporting the development of consensus statements.

Objective This study investigates the relevance and dissemination of the IOC consensus statements among sports medicine professionals directly involved in Olympic athlete health in a developed setting (Australia).

Design Qualitative case study.

Methods Semi-structured interviews, document analysis and field notes were utilised. Seven sports medicine professionals were interviewed.

Results For clinicians (not active in an academic/research setting), knowledge of the statements was limited; invitation to the study was the first awareness of the statements. Participants in leadership roles (with an academic/research component) were generally more familiar with some, but not all, statements. Participants identified a wealth of competing information sources through professional networks in health and sport. Subsequently, participants tend to consider these other avenues as first access point for information. Where statements were identified and used, there were several benefits reported, particularly drawn from the perceived leadership, trust, brand and reach of the IOC. While there is no formal adoption process for the information contained within a consensus statement, where identified as relevant, the information is shared amongst peer networks, via email or face-to-face meetings/seminars. There was agreement that the IOC has a role in the development and dissemination of the statements. However, interviewees also stated that information that is current and tailored to the target audiences (clinicians, coaches or athletes) could enhance the IOC's objective of guiding reference on athlete health.

Conclusions A wealth of information is available to sports medicine professionals in Australia. Therefore, to enhance relevance and dissemination in a developed country, the IOC consensus statements must remain current and be tailored to target audiences.

THE ENGLISH INSTITUTE OF SPORT'S MENTAL HEALTH JOURNEY

Samuel Cumming, Craig Ranson. *English Institute of Sport, Manchester, UK*

10.1136/bjsports-2021-IOC.347

Background Following a number of reviews into Olympic and Paralympic sport in the UK it was identified that mental health would be an area of focus for the Tokyo cycle. This led to development and implementation of a specific mental health strategy consisting of four pillars; education, provision, communication and assurance.

Implementation of a strategy to better-support the mental health of all people within the UK's High Performance System.

Design Retrospective service evaluation of the implementation of UK Sport's Mental Health Strategy, using statistics relating to two of the strategy's four pillars – Education and Provision.

Setting Athletes and staff who are part of the UK's High Performance Sports System.

Participants Athletes and staff from the UK's High Performance Sports System.

Intervention A Mental Health Expert Panel was established in late 2018 to provide world-leading expert advice and guidance to the system on matters relating to mental health. In addition, an elite sport-specific mental health education programme was designed and delivered between 2019 and 2020.

Main outcome measurements The primary outcome measures focus on usage of and feedback on the newly implemented initiatives (i.e. the Mental Health Expert Panel and education programme).

Results We observed significant uptake of mental health services (e.g. requests to access EIS Mental Health Expert Panel;

delivery of education workshops). Data from athletes' medical insurance scheme showed that the number of claims for mental health have increased and the average costs of these claims has decreased.

Conclusion Good start; high uptake in MHEP led to increasing their time; education programme built upon with MH Champions programme; possible correlation between increased awareness and earlier intervention, and increasing number of claims for mental health support with decreasing average cost; levels of psychological distress and wellbeing similar to levels observed in wider society.

IMPLEMENTATION OF PSYCHIATRIC/PSYCHOTHERAPEUTIC SUPPORT WITHIN A LONGITUDINAL HEALTH MONITORING IN COMPETITIVE PARA ATHLETES

¹Petra Dallmann, ²Rainer Leonhart, ³Anja Hirschmüller. ¹Department of General Psychiatry, Center for Psychosocial Medicine, Heidelberg University Hospital, Heidelberg University, Heidelberg, Germany; ²University of Freiburg, Department of Psychology, Freiburg, Germany; ³Department of Orthopedics and Trauma Surgery, Medical Center – Albert-Ludwigs-University of Freiburg, Faculty of Medicine, Albert-Ludwigs-University, Freiburg, Germany

10.1136/bjsports-2021-IOC.348

Background Longitudinal monitoring of mental health symptoms in para athletes is rare, so are strategies to prevent and detect mental illnesses in this group. Ideas to lower barriers for seeking for mental help are needed.

Objective Implementation of a mental health surveillance system, using the PHQ (Patient Health Questionnaire)-4 in high-level Paralympic athletes in combination with a psychiatric/psychotherapeutic support which provided help either if athletes demanded or if PHQ-4 score exceeded 4 two weeks or longer.

Design Longitudinal weekly monitoring of depression and anxiety within the German National Paralympic Team accompanied by psychiatric/psychotherapeutic intervention.

Setting In preparation of the Paralympic Games in Tokyo, German athletes were invited to take part in a weekly, questionnaire-based monitoring program which included the PHQ-4 and level of stress.

Patients (or Participants) Data of 78 athletes was collected for one year (05/19–04/20). Within this group 21 athletes were contacted (8 male, 13 female, 8 individual sport, 13 team sport), 4 of them more than on one occasion.

Interventions (or Assessment of Risk Factors) Athletes were contacted via Email and offered support regarding mental health problems in case they requested help or if their PHQ-4 scores overreached the cut-off value of 4 in at least 2 consecutive weeks.

Main Outcome Measurements Number of athletes contacted because of PHQ-4, number of athletes demanding support and number of contacts which resulted in consultation during one year.

Results Twenty-one of 78 athletes were contacted, 11 times on demand, 13 times because of PHQ-4 scores. After the first contact psychiatric/psychotherapeutic support was requested 8 times, by 7 different athletes. This resulted in 7 phone calls and 1 email conversation. Seven of the 8 requests were on demand, whereas only one resulted from

elevated PHQ-4 scores. Recommendations for sport psychology (n=2), psychiatrist/psychotherapy (n=4) were given six times. Help to find a local sport psychiatry/psychotherapy specialist was provided in 4 cases, questions concerning medication were answered in 1 case and support in an acute stress situation in 1 case.

Conclusions The demand for psychiatric/psychotherapeutic support was high (9% of all athletes within one year). Offering an easy access to psychiatric/psychotherapeutic help seems to be an effective way to support athletes concerning mental health issues.

MAXIMISING THE RELEVANCE AND DISSEMINATION OF THE IOC MEDICAL CONSENSUS STATEMENTS: WHAT ARE THE CONSENSUS STATEMENTS AND HOW ARE THEY USED IN LITERATURE?

¹Caroline Finch, ¹Lauren Fortington, ⁴Marelise Badenhorst, ¹Rebecca Handcock, ²Evert Verhagen, ⁵Martin Schwellnus, ³Carolyn Emery, ³Kati Pasanen, ⁴Wayne Derman. ¹Australian Centre for Research into Injury in Sport and its Prevention (ACRISP), School of Medical and Health Sciences, Edith Cowan University, Joondalup, Australia; ²Amsterdam Collaboration on Health and Safety in Sports, Department of Public and Occupational Health, Amsterdam UMC, Amsterdam, Netherlands; ³Sport Injury Prevention Research Centre, University of Calgary, Calgary, Canada; ⁴Institute of Sport and Exercise Medicine, University of Stellenbosch, Stellenbosch, South Africa; ⁵Sport, Exercise Medicine and Lifestyle Institute (SEMLI), University of Pretoria, Pretoria, South Africa

10.1136/bjsports-2021-IOC.349

Background The International Olympic Committee (IOC) Medical and Scientific Commission has a goal to provide guidance on athlete health for sports organisations. One strategy to meet this goal has been the development and publication of sports medicine consensus statements. It is currently unknown if there has been use of the consensus statements or if the overall goal of the statements – to improve athlete health and wellbeing – has been achieved.

Objective To identify and summarise citation measures of the IOC medical consensus statements.

Design Citation analysis.

Methods IOC medical consensus statements published from 2004 to 2018, and citing publications, were sourced from the IOC website, Scopus database and Google Scholar. Descriptive analyses over time of the number of consensus statements and citing documents with summaries of the authorship countries and keywords. Citation analyses were conducted to model links between consensus statements and citing publications, field weighted citation index (FWCI), and the SCImago Journal Ranking.

Results Twenty-seven consensus statements linked to the IOC medical and scientific commission were identified, addressing a range of topics from broad health and social issues to specific clinical topics. Authors from 30 countries contributed to the statements while citing papers were authored from 86 countries. Concussion was the most prominent key term in all citing documents. The youth athletic development statement has the highest FWCI (19.6), followed by concussion (18.8); load (12.3); relative energy deficiency (11.3); platelet-rich plasma (10.1); and supplements (9.9).

Conclusions Several consensus statements are widely used and cited in the literature while others have been less impactful through citation measures. The countries that use and cite
