### eMethods1, Definition of sports injury

This article will define an injury as;

“Any physical complaint sustained by an individual that result from sports-related physical activity, irrespective of the need for medical attention or time loss from sports-related physical activities. An injury that results in an individual receiving medical attention is referred to as a “medical attention” injury, and an injury that results in an individual being unable to take a full part in sports-related activities as a “time loss” injury.”

This definition originates in the F-MARC consensus group concerning soccer injuries and has merely been fitted to the scope of this analysis.

### eMethods3, Detailed study selection description

The above searches revealed 3462 results

3462 sorted for duplicates (if identical title and first author) and reference type

- 686 referenceduplicates (2776 left)
- 2 book sections, 1 case, 5 newspaper articles, and 1 blank reference (2767 left)

2767 sorted by title

- 2677 excluded

90 sorted by abstract

- 43 studies sorted by screening for exclusion criteria
- 2 studies had inappropriate control group  
(*“Buist, I., No effect of a graded training program on the number of running-related injuries in novice runners”/“Childs, J.D., Effects of Traditional Sit-up Training Versus Core Stabilization Exercises on Short-Term Musculoskeletal Injuries in US Army Soldiers: A Cluster Randomized Trial”*)
- 1 report duplicate  
(*“Canham-Chervak, M., Does stretching before exercise prevent lower-limb injury?”* same as *“Pope, R. P., A randomized trial of preexercise stretching for prevention of lower-limb injury”*)
- 1 study had prevalence as outcome  
(*“Cumps, E., Effect of a preventive intervention programme on the prevalence of anterior knee pain in volleyball players”*)
- 1 study included "healthy" participants regarded by the authors of this meta-analysis as having a "medical attention injury"  
  
(*“Fredberg, U., Prophylactic training in asymptomatic soccer players with ultrasonographic abnormalities in Achilles and patellar tendons - The Danish super league study”*)
- 1 study had information/safety equipment as intervention  
(*“Kendrick, D., Preventing injuries in children: cluster randomised controlled trial in primary care”*)
- 1 study was a review  
(*“O'Neill, T., Can we prevent fractures?”*)

40 sorted by full text

- 4 references were conference abstracts or course lectures  
(“Emery C., *The effectiveness of a combined sport injury and obesity prevention program in junior high school*”/”Richmond S., *Examining a sport injury and obesity intervention program in junior high school*”/”Sinaki M., *Stronger back muscles reduce the incidence of vertebral fractures: A prospective 10 year follow-up of postmenopausal women*”/”Myklebust G., *Prevention of noncontact anterior cruciate ligament injuries in elite and adolescent female team handball athletes*”)
- 3 references were study protocols  
(“van Beijsterveldt A., *Effectiveness and cost-effectiveness of an injury prevention programme for adult male amateur soccer players: design of a cluster-randomised controlled trial*”/”Finch C. *The Preventing Australian Football Injuries with Exercise (PAFIX) Study: a group randomised controlled trial*”/”Bredeweg S., *The GRONORUN 2 study: effectiveness of a preconditioning program on preventing running related injuries in novice runners. The design of a randomized controlled trial*”)
- 3 studies weren't randomized  
(“Gatterer H., *Effects of the performance level and the FIFA "11" injury prevention program on the injury rate in Italian male amateur soccer players*”/”Kiani A., *Prevention of Soccer-Related Knee Injuries in Teenaged Girls*”, “Caraffa A., *Prevention of anterior cruciate ligament injuries in soccer. A prospective controlled study of proprioceptive training*”)
- 2 study had control group defined as physical activity by this study  
(“Bello M., *Rhythmic stabilization versus conventional passive stretching to prevent injuries in indoor soccer athletes: A controlled clinical trial*”/”Gabbe B., *A pilot randomised controlled trial of eccentric exercise to prevent hamstring injuries in community-level Australian football*”)
- 2 studies with cluster randomization of 4 clusters and no adjustment for cluster effect were considered inadequate

(“Parkkari J., *Neuromuscular training with injury prevention counselling to decrease the risk of acute musculoskeletal injury in young men during military service: a population-based, randomised study*”/”Verhagen E., *Acute physical activity and sports injuries in children*”)

- 2 studies had physical activity intervention regarded insufficient for this analysis  
(“Collard D., *Effectiveness of a school-based physical activity injury prevention program: a cluster randomized controlled trial*”/”van Mechelen W., *Prevention of running injuries by warm-up, cool-down, and stretching exercises*”)
- 2 report duplicates

2 articles included from article references were added to 22 articles

- “Askling C., *Hamstring injury occurrence in elite soccer players after preseason strength training with eccentric overload*”
- “Heidt R., *Avoidance of soccer injuries with preseason conditioning*”

1 article included by the literature search update Jan 2013 was added to 24 articles

- “van Beijsterveldt A., *Effectiveness of an injury prevention programme for adult male amateur soccer players: a cluster-randomised controlled trial*”

25 articles for final inclusion

#### eMethods4, Quality assessments of included studies

Asking et al., Hamstring injury occurrence in elite soccer players after preseason strength training with eccentric overload

Random sequence generation	Reported	<i>"were randomly assigned to either"</i>
	Judgement	<b>Low</b> risk of bias
Allocation concealment	Reported	N/A
	Judgement	<b>Unclear</b> risk of bias
Blinding of participants/personnel	Reported	<i>"Before the start of the study, the players, coaches and medical personnel of the two teams were informed about the purpose and the design of the study"</i>
	Judgement	<b>High</b> risk of bias
Blinding of outcome assessment	Reported	<i>"Before the start of the study, the players, coaches and medical personnel of the two teams were informed about the purpose and the design of the study"</i>  <i>"medical personnel of each team were not part of the study, thus avoiding bias"</i>
	Judgement	<b>Low</b> risk of bias
Incomplete outcome data	Reported	<i>Comment: No reported dropout or missing data</i>
	Judgement	<b>Low</b> risk of bias
Selective reporting	Reported	<i>Comment: A clinical trials registry study protocol wasn't available but the published reports appear to include all expected outcomes, including those that were pre-specified in the method section of this article</i>
	Judgement	<b>Low</b> risk of bias
Other bias	Reported	<i>Comment: Intention-to-treat analysis performed</i>  <i>Comment: Possible contamination between study arms may underestimate intervention effect</i>
	Judgement	<b>Low</b> risk of bias

Beijsterveldt et al., effect Effectiveness of an injury prevention programme for adult male amateur soccer players: a cluster-randomised controlled trial

Random sequence generation	Reported	<i>Published study protocol reference: "Randomisation was done independently by drawing lots"</i>
	Judgement	<b>Low</b> risk of bias
Allocation concealment	Reported	N/A
	Judgement	<b>Unclear</b> risk of bias
Blinding of participants/personnel	Reported	<i>Published study protocol reference: "The research team gave the clubs and their first team coaches information about the aims of the trial. The control group was asked to participate in a study on injury incidence and characteristics of practice sessions"</i>
	Judgement	<b>Low</b> risk of bias
Blinding of outcome assessment	Reported	N/A
	Judgement	<b>Unclear</b> risk of bias
Incomplete outcome data	Reported	<i>"Shortly after randomisation, the coach of one team from the intervention group refused to use The11 during the practice sessions"</i>  <i>Comment: The above should count as dropout as the team were randomized at this point. This means a dropout of 39 from the intervention group and 13 players from the control group according to the study flow chart</i>
	Judgement	<b>High</b> risk of bias
Selective reporting	Reported	<i>Comment: A clinical trials registry study was available but the published article don't report the pre-specified Cox regression or any satisfactory measures of first-time injury</i>
	Judgement	<b>High</b> risk of bias

Other bias	Reported	<i>Comment: Intention-to-treat analysis performed. Sample size calculations based in inflation factor estimate but no report of actual cluster adjustments in either study protocol or published report</i>
	Judgement	<b>High</b> risk of bias

Brushoj et al., Prevention of overuse injuries by a concurrent exercise program in subjects exposed to an increase in training load - A randomized controlled trial of 1020 army recruits

Random sequence generation	Reported	<i>"The conscripts were randomly divided (by personal registration number) into 8 companies each consisting of 3 platoons"</i>  <i>Comment: True cluster-randomization was achieved as personal registration numbers are randomly generated in Denmark</i>
	Judgement	<b>Low</b> risk of bias
Allocation concealment	Reported	<i>"randomization was performed by the head nurse, who otherwise did not participate in the study"</i>
	Judgement	<b>Low</b> risk of bias
Blinding of participants/personnel	Reported	<i>"the recruits did not know which of the training programs was being tested"</i>  <i>"before their examination, the patients were informed by the head nurse not to reveal what exercise group they were allocated to"</i>
	Judgement	<b>Low</b> risk of bias
Blinding of outcome assessment	Reported	<i>"before their examination, the patients were informed by the head nurse not to reveal what exercise group they were allocated to"</i>
	Judgement	<b>Low</b> risk of bias
Incomplete outcome data	Reported	<i>"Attrition reasons not related to the present study"</i>  <i>Comment: Attrition of 20 and 23 in intervention and control group, respectively.</i>
	Judgement	<b>Low</b> risk of bias
Selective reporting	Reported	<i>Comment: No clinical trials registry study protocol available and no pooled estimate for pre-specified primary outcomes</i>
	Judgement	<b>High</b> risk of bias
Other bias	Reported	<i>Comment: No intention-to-treat analysis or cluster adjustments</i>  <i>Comment: Concurrent training in high risk period may be detrimental for overuse injuries and may lead to an increased injury risk in the intervention group.</i>
	Judgement	<b>High</b> risk of bias

Coppack et al., The Effects of Exercise for the Prevention of Overuse Anterior Knee Pain A Randomized Controlled Trial

Random sequence generation	Reported	<i>"A simple randomization procedure based on a computer-generated table of random numbers"</i>
	Judgement	<b>Low</b> risk of bias
Allocation concealment	Reported	<i>"An external administrator provided the group assignment"</i>
	Judgement	<b>Low</b> risk of bias
Blinding of participants/personnel	Reported	<i>"An attempt was made to blind participants, but given the physical nature of the intervention, we refrain from calling this a double-blinded study"</i>  <i>Comment: participant blinding attempt through the application of dummy warm-up exercises for control group participants</i>
	Judgement	<b>Low</b> risk of bias
Blinding of outcome assessment	Reported	<i>"Participants... were instructed not to reveal information about sessions to the AKP outcome assessor (physiotherapist)"</i>
	Judgement	<b>Low</b> risk of bias
Incomplete	Reported	<i>"Because of the military setting, no individuals were lost to follow-up"</i>

outcome data		<i>"there was no evidence to suggest a difference in voluntary discharge rate between groups (P&gt;0,05)"</i>
	Judgement	<b>Low</b> risk of bias
Selective reporting	Reported	<i>Comment: A clinical trials registry study protocol wasn't available but the published reports appear to include all expected outcomes, including those that were pre-specified in the method section of this article</i>
	Judgement	<b>Low</b> risk of bias
Other bias	Reported	<i>Comment: Adjustment for clustering effect and intention-to-treat performed</i>
	Judgement	<b>Low</b> risk of bias

Eils et al., Multistation proprioceptive exercise program prevents ankle injuries in basketball

Random sequence generation	Reported	<i>"198 subjects were randomly assigned to the control or the training group using a stratified randomization design, with the strata defined by performance (high, middle, or low) and sex"</i>
	Judgement	<i>Comment: Performed by computer</i> <b>Low</b> risk of bias
Allocation concealment	Reported	<i>Comment: No blinding</i>
	Judgement	<b>High</b> risk of bias
Blinding of participants/personnel	Reported	<i>Comment: Description of injury assessment and reporting indicate that blinding haven't been performed</i>
	Judgement	<b>High</b> risk of bias
Blinding of outcome assessment	Reported	<i>Comment: Description of injury assessment and reporting indicate that blinding haven't been performed</i>
	Judgement	<b>High</b> risk of bias
Incomplete outcome data	Reported	<i>Comment: Figure 1 shows 15 and 11 lost to follow-up for training and control, respectively. Attrition is fairly balanced between the two groups with similar reasons for missing data reported.</i>
	Judgement	<b>Low</b> risk of bias
Selective reporting	Reported	<i>Comment: A clinical trials registry study protocol wasn't available but the published reports appear to include all expected outcomes, including those that were pre-specified in the method section of this article</i>
	Judgement	<b>Low</b> risk of bias
Other bias	Reported	<i>Comment: No mention of intention-to-treat or adjustment for clustering effects</i>
	Judgement	<b>High</b> risk of bias

Emery et al. 2005, Effectiveness of a home-based balance-training program in reducing sports-related injuries among healthy adolescents: a cluster randomized controlled trial

Random sequence generation	Reported	<i>"Computer generated random numbers were used to recruit schools and students and to allocate the schools to the intervention or control group"</i>
	Judgement	<b>Low</b> risk of bias
Allocation concealment	Reported	<i>"Computer generated random numbers"</i>
	Judgement	<b>Low</b> risk of bias
Blinding of participants/personnel	Reported	<i>"The study was blinded in that we randomly allocated schools to the intervention or control group following initial subject recruitment"</i>
	Judgement	<i>Comment: This doesn't in itself ensure blinding but given the nature of interventions in most of the included studies in this paper an effort is considered to at least minimize the risk of bias in comparison to studies that provide full info to all participants</i> <b>Low</b> risk of bias
Blinding of outcome assessment	Reported	N/A
	Judgement	<b>Unclear</b> risk of bias

Incomplete outcome data	Reported	<i>Comment: Participation flow chart states 6 and 7 exclusions from the intervention and control group, respectively. Exclusion reasons are stated and there are no indices that these shouldn't be balanced between groups or being of dissimilar reasons.</i>
	Judgement	<b>Low</b> risk of bias
Selective reporting	Reported	<i>Comment: A clinical trials registry study protocol wasn't available but the published reports appear to include all expected outcomes, including those that were pre-specified in the method section of this article</i>
	Judgement	<b>Low</b> risk of bias
Other bias	Reported	<i>Comment: Adjustment for clustering effects performed. Rate of collected data on compliance was low (43,3%) but as intention-to-treat analysis was performed this would lead to an underestimation of the effect of the intervention effect and the conclusions of this study therefore seems robust</i>
	Judgement	<b>Low</b> risk of bias

Emery et al. 2010, The effectiveness of a neuromuscular prevention strategy to reduce injuries in youth soccer: a cluster-randomised controlled trial

Random sequence generation	Reported	<i>"Teams were randomised by club"</i>
	Judgement	<b>Low</b> risk of bias
Allocation concealment	Reported	<i>"Randomisation was revealed following recruitment of teams to ensure allocation concealment"</i>
	Judgement	<b>High</b> risk of bias
Blinding of participants/personnel	Reported	<i>"Teams were blinded to the details of the other study-group programmes"</i>  <i>Comment: Control group did a standard warm-up which made it possible to blind participants</i>
	Judgement	<b>Low</b> risk of bias
Blinding of outcome assessment	Reported	<i>"A study therapist (physiotherapist or athletic therapist) blinded to study group allocation was on site"</i>
	Judgement	<b>Low</b> risk of bias
Incomplete outcome data	Reported	<i>Comment: Participant flow chart shows an attrition of 89 individuals in the training group and 52 from the control group. Team dropout after randomization was considered uneven</i>
	Judgement	<b>High</b> risk of bias
Selective reporting	Reported	<i>Comment: A clinical trials registry study protocol wasn't available but the published reports appear to include all expected outcomes, including those that were pre-specified in the method section of this article</i>
	Judgement	<b>Low</b> risk of bias
Other bias	Reported	<i>Comment: Adjusted for clustering effects.</i>  <i>Comment: Rate of collected data on compliance was poor (&lt;15%) but as intention-to-treat analysis was performed this would lead to an underestimation of the effect of the intervention effect and the conclusions of this study therefore seems robust</i>  <i>Comment: Statistically significant difference in gender distribution at baseline</i>
	Judgement	<b>Low</b> risk of bias

Emery et al. 2007, A prevention strategy to reduce the incidence of injury in high school basketball: a cluster randomized controlled trial

Random sequence generation	Reported	<i>"Random selection of schools was done by computer generation of random numbers"</i>
	Judgement	<b>Low</b> risk of bias
Allocation concealment	Reported	<i>"following subject recruitment to ensure allocation concealment"</i>
	Judgement	<b>Unclear</b> risk of bias

Blinding of participants/personnel	Reported	<i>Comment: Subject blinding haven't been mentioned but design make true blinding possible</i>
	Judgement	<b>Unclear</b> risk of bias
Blinding of outcome assessment	Reported	<i>"The team therapist was blinded to training group allocation"</i>
	Judgement	<b>Low</b> risk of bias
Incomplete outcome data	Reported	<i>Comment: Participation flow chart report a dropout of one team (n = 11 subjects) from intervention group.</i>
	Judgement	<b>Low</b> risk of bias
Selective reporting	Reported	<i>Comment: A clinical trials registry study protocol wasn't available but the published reports appear to include all expected outcomes, including those that were pre-specified in the method section of this article</i>
	Judgement	<b>Low</b> risk of bias
Other bias	Reported	<i>Comment: Adjusted for clustering effects and analysed by intention-to-treat</i>
	Judgement	<b>Low</b> risk of bias

Gilchrist et al., A Randomized Controlled Trial to Prevent Non contact Anterior Cruciate Ligament Injury in Female Collegiate Soccer Players

Random sequence generation	Reported	<i>"Intervention and control teams were paired by proximity"</i>  <i>"Pairs were clustered geographically by region... and one pair from each region was selected randomly for observation"</i>
	Judgement	<b>Low</b> risk of bias
Allocation concealment	Reported	<i>"Participation and injury reports were submitted weekly by facsimile to study staff using codes for both teams and individual athletes for confidentiality"</i>
	Judgement	<b>Low</b> risk of bias
Blinding of participants/personnel	Reported	<i>"Each team's ATC provided the athletes an overview of the study"</i>
	Judgement	<b>High</b> risk of bias
Blinding of outcome assessment	Reported	<i>"an ACL injury was counted only if the ATC reported confirmation by magnetic resonance imaging, arthroscopy, or direct visualization at the time of repair"</i>  <i>Comment: The above methods ensure a high level of objectiveness but, MR especially, can still contain a component of assessment.</i>
	Judgement	<b>Low</b> risk of bias
Incomplete outcome data	Reported	<i>"Eight intervention teams were excluded from the analysis because they did not use the program 12 or more times"</i>  <i>Comment: Twelve teams dropped out after randomization from intervention group and two from control group</i>
	Judgement	<b>High</b> risk of bias
Selective reporting	Reported	<i>Comment: A clinical trials registry study protocol wasn't available but the published reports appear to include all expected outcomes, including those that were pre-specified in the method section of this article</i>
	Judgement	<b>Low</b> risk of bias
Other bias	Reported	<i>Comment: No intention-to-treat analysis or adjustment attempts for clustering effects</i>
	Judgement	<b>High</b> risk of bias

Heidt et al., Avoidance of soccer injuries with preseason conditioning

Random sequence generation	Reported	<i>"Before the start of the select season, 42 of these players were randomly selected to participate in the Frapier Acceleration Training Program"</i>
	Judgement	<b>Low</b> risk of bias
Allocation	Reported	N/A

concealment	Judgement	<b>Unclear</b> risk of bias
Blinding of participants/personnel	Reported	<i>Comment: Customized athlete training makes blinding impossible</i>
	Judgement	<b>High</b> risk of bias
Blinding of outcome assessment	Reported	<i>"The athletic trainers were blinded as to which athletes participated in the preseason training program"</i>
	Judgement	<b>Low</b> risk of bias
Incomplete outcome data	Reported	<i>Comment: All 300 participants was included in analysis</i>
	Judgement	<b>Low</b> risk of bias
Selective reporting	Reported	<i>Comment: A clinical trials registry study protocol wasn't available but the published reports appear to include all expected outcomes, including those that were pre-specified in the method section of this article</i>
	Judgement	<b>Low</b> risk of bias
Other bias	Reported	<i>Comment: Intention-to-treat analysis were performed and no serious sources of bias were found</i>
	Judgement	<b>Low</b> risk of bias

Holmich et al., Exercise program for prevention of groin pain in football players: a cluster-randomized trial

Random sequence generation	Reported	<i>"randomized to the prevention group (PG) or the CG by block randomization (block size two). The randomization was computer generated"</i>
	Judgement	<b>Low</b> risk of bias
Allocation concealment	Reported	<i>"The individual physiotherapists and coaches were informed about the allocation of their club by a letter in a sealed and opaque envelope mailed by a secretary not involved in the analysis of the data"</i>
	Judgement	<b>Low</b> risk of bias
Blinding of participants/personnel	Reported	<i>"Because of the nature of the intervention, blinding of the participants and observers (physiotherapist and coach) was not possible"</i>  <i>"The data manager, the statistician, and the authors were all blinded to the result of the randomization"</i>
	Judgement	<b>Low</b> risk of bias
Blinding of outcome assessment	Reported	<i>"Because of the nature of the intervention, blinding of the participants and observers (physiotherapist and coach) was not possible"</i>
	Judgement	<b>High</b> risk of bias
Incomplete outcome data	Reported	<i>"Because this ... was evenly distributed between the two allocations, we do not find this alarming from a trial quality point of view but very unfortunate from a sample size point of view."</i>
	Judgement	<b>High</b> risk of bias
Selective reporting	Reported	<i>Comment: No clinical trials registry study protocol available and results of the claimed intention-to-treat analysis wasn't reported</i>
	Judgement	<b>High</b> risk of bias
Other bias	Reported	<i>Comment: Adjusted for intracluster correlation and intention-to-treat analysis was performed but was not reported</i>  <i>Comment: With 907 injuries in 977 individuals repeated injuries must have been included.</i>
	Judgement	<b>High</b> risk of bias

Jamtvedt et al., A pragmatic randomised trial of stretching before and after physical activity to prevent injury and soreness

Random sequence generation	Reported	<i>"The randomisation schedule was unrestricted (no stratification or blocking) and was administered by computer"</i>
	Judgement	<b>Low</b> risk of bias
Allocation concealment	Reported	<i>"The allocation code was not broken until the analyses were compared and found to yield the same results"</i>
	Judgement	<b>Low</b> risk of bias
Blinding of participants/personnel	Reported	<i>Comment: No attempts to blind participants were described. The recruitment methods make it unlikely that participants have been blinded</i>
	Judgement	<b>High</b> risk of bias
Blinding of outcome assessment	Reported	<i>"Participants who experienced an injury of the lower limb or back in the past week were asked to provide details about the injury."</i>  <i>Comment: No mention of injury-confirmation procedures</i>
	Judgement	<b>High</b> risk of bias
Incomplete outcome data	Reported	<i>"Completeness of reporting was similar in the two groups"</i>
	Judgement	<b>Low</b> risk of bias
Selective reporting	Reported	<i>Comment: A clinical trials registry study protocol wasn't available but the published reports appear to include all expected outcomes, including those that were pre-specified in the method section of this article</i>
	Judgement	<b>Low</b> risk of bias

Other bias	Reported	<i>Comment: In the stretching group only 38,4% and 7,7%, respectively, complied fully or almost fully with target frequency and target duration. This could lead to an underestimation of the effect and may originate in the limitations on participant motivation over the internet</i>
	Judgement	<b>High</b> risk of bias

LaBella et al., Effect of neuromuscular warm-up on injuries in female soccer and basketball athletes in urban public high schools: cluster randomized controlled trial

Random sequence generation	Reported	<i>"The statistician generated the randomization sequence using an online random number generator program"</i>  <i>Comment: A minimization was conducted</i>
	Judgement	<b>Low</b> risk of bias
Allocation concealment	Reported	<i>"The research coordinator (J.G.) informed coaches of their allocation"</i>
	Judgement	<b>High</b> risk of bias
Blinding of participants/personnel	Reported	<i>"The research coordinator (J.G.) informed coaches of their allocation"</i>  <i>"The research assistants (RAs) were not blinded to group assignments"</i>  <i>"We minimized this potential bias by objectively defining injury as one causing missed time from practice or game, and when a physician's diagnosis was unavailable, RA's consulted the principal investigator, who was blinded"</i>
	Judgement	<b>High</b> risk of bias
Blinding of outcome assessment	Reported	<i>"The principal investigator and coinvestigators were blinded until data collection was complete"</i>
	Judgement	<b>Low</b> risk of bias
Incomplete outcome data	Reported	<i>"Drop-out rates were 6% for control coaches and 4% for intervention coaches"</i>
	Judgement	<b>Low</b> risk of bias
Selective reporting	Reported	<i>Comment: A clinical trials registry study protocol wasn't available but the published reports lack a total estimate for primary outcome</i>
	Judgement	<b>High</b> risk of bias
Other bias	Reported	<i>Comment: Intention-to-treat analysis was performed but adjustments for clustering effects wasn't accounted for on primary outcome</i>
	Judgement	<b>High</b> risk of bias

Longo et al., The FIFA 11+ Program Is Effective in Preventing Injuries in Elite Male Basketball Players A Cluster Randomized Controlled Trial

Random sequence generation	Reported	<i>"Randomization was done independently by drawing lots"</i>
	Judgement	<b>Low</b> risk of bias
Allocation concealment	Reported	<i>"The statistician who conducted the randomization did not take part in the study"</i>
	Judgement	<b>Low</b> risk of bias
Blinding of participants/personnel	Reported	<i>"Another limitation of this study is that teams were not blinded to the exercise program"</i>
	Judgement	<b>High</b> risk of bias
Blinding of outcome assessment	Reported	<i>Comment: Team medical staff reported to blinded orthopaedic personnel</i>
	Judgement	<b>Low</b> risk of bias
Incomplete outcome data	Reported	<i>Comment: Participants flow chart reveal 0 lost to final follow-up</i>
	Judgement	<b>Low</b> risk of bias
Selective reporting	Reported	<i>Comment: A clinical trials registry study protocol wasn't available but the published reports appear to include all expected outcomes, including those that were pre-specified in the method section of this article</i>
	Judgement	<b>Low</b> risk of bias

Other bias	Reported	<i>Comment: Analyzed by intention-to-treat but no adjustments for clustering effects</i>
	Judgement	<b>High</b> risk of bias

McGuine et al., The effect of a balance training program on the risk of ankle sprains in high school athletes

Random sequence generation	Reported	<i>"Randomization into intervention and controls was performed using groups of two based on a schedule provided by the statistician"</i>
	Judgement	<b>Low</b> risk of bias
Allocation concealment	Reported	<i>N/A</i>
	Judgement	<b>Unclear</b> risk of bias
Blinding of participants/personnel	Reported	<i>"Subjects performing the intervention knew they were doing so to prevent ankle sprains"</i>
	Judgement	<b>High</b> risk of bias
Blinding of outcome assessment	Reported	<i>"the ATCs at the schools knew which teams were in the control and intervention groups"</i>
	Judgement	<b>High</b> risk of bias
Incomplete outcome data	Reported	<i>"(n = 11) of athletes dropped out of the study when they stopped participating on their interscholastic team and were included in the analysis through the last day of their team membership"</i>
	Judgement	<b>Low</b> risk of bias
Selective reporting	Reported	<i>Comment: A clinical trials registry study protocol wasn't available but the published reports appear to include all expected outcomes, including those that were pre-specified in the method section of this article</i>
	Judgement	<b>Low</b> risk of bias
Other bias	Reported	<i>Comment: Intention-to-treat analysis performed but no adjustments for clustering effects</i>
	Judgement	<b>High</b> risk of bias

Olsen et al., Exercises to prevent lower limb injuries in youth sports: cluster randomised controlled trial

Random sequence generation	Reported	<i>"block randomised these, with four clubs in each block to an intervention or control group"</i>
	Judgement	<b>Low</b> risk of bias
Allocation concealment	Reported	<i>"The statistician who conducted the randomisation was not involved in the intervention"</i>  <i>"Data on injury and exposure were reported by the physiotherapist using a web based database in which all the data were coded anonymously"</i>
	Judgement	<b>Low</b> risk of bias
Blinding of participants/personnel	Reported	<i>Comment: teams were informed of allocation</i>
	Judgement	<b>High</b> risk of bias
Blinding of outcome assessment	Reported	<i>"Ten research physiotherapists who were blinded to group allocation recorded injuries in both groups"</i>
	Judgement	<b>Low</b> risk of bias
Incomplete outcome data	Reported	<i>"Data on players who dropped out during the study period were included for the entire period of their participation"</i>  <i>Comment: Participants flow chart show 30 dropouts from intervention and 19 from control group and no difference in dropout rates</i>
	Judgement	<b>Low</b> risk of bias
Selective reporting	Reported	<i>"We undertook all statistical analyses according to a pre-specified plan"</i>  <i>Comment: A clinical trials registry study protocol wasn't available</i>
	Judgement	<b>Low</b> risk of bias
Other bias	Reported	<i>Comment: Well powered and design/analyses appears strong</i>
	Judgement	<b>Low</b> risk of bias

Pasanen et al., Neuromuscular training and the risk of leg injuries in female floorball players: cluster randomised controlled study

Random sequence generation	Reported	<i>"computer-generated randomisation"</i>
	Judgement	<b>Low</b> risk of bias
Allocation concealment	Reported	<i>"The statistician (MP) who carried out the computer-generated randomisation was not involved in the intervention"</i>
	Judgement	<b>Low</b> risk of bias
Blinding of participants/personnel	Reported	<i>"We informed the teams allocated to the intervention group about the upcoming training programme for preventing injuries"</i>
	Judgement	<b>High</b> risk of bias
Blinding of outcome assessment	Reported	<i>Comment: study doctor was "not involved in the intervention"</i>
	Judgement	<b>Low</b> risk of bias
Incomplete outcome data	Reported	<i>Comment: Participant flow chart showed 9 dropouts in each group, all were players with no contract</i>
	Judgement	<b>Low</b> risk of bias
Selective reporting	Reported	<i>Comment: Clinical trials registry study protocol was available and inclusion criteria, intervention, and outcomes corresponded to the reported study</i>
	Judgement	<b>Low</b> risk of bias
Other bias	Reported	<i>Comment: Sufficiently powered and design/analyses appears strong with both intention-to-treat analysis and adjustments for clustering effects</i>
	Judgement	<b>Low</b> risk of bias

Petersen et al., Preventive effect of eccentric training on acute hamstring injuries in men's soccer: a cluster-randomized controlled trial

Random sequence generation	Reported	<i>"An independent research assistant did the randomization procedure by drawing a sealed, opaque envelope containing a team name followed by drawing another sealed, opaque envelope containing the allocation group"</i>
	Judgement	<b>Low</b> risk of bias
Allocation concealment	Reported	<i>"An independent research assistant did the randomization procedure by drawing a sealed, opaque envelope containing a team name followed by drawing another sealed, opaque envelope containing the allocation group"</i>
	Judgement	<b>Low</b> risk of bias
Blinding of participants/personnel	Reported	<i>"the person responsible for the day-to-day running of the project, medical staff within the teams, and all players were aware of group allocation"</i>
	Judgement	<b>High</b> risk of bias
Blinding of outcome assessment	Reported	<i>"Reasons for dropping out were transfer or stop of active career"</i>
	Judgement	<b>Low</b> risk of bias
Incomplete outcome data	Reported	<i>Comment: Dropout rates were 8% and 9% for intervention and control groups, respectively</i>
	Judgement	<b>Low</b> risk of bias
Selective reporting	Reported	<i>Comment: A clinical trials registry study protocol wasn't available but the published reports appear to include all expected outcomes, including those that were pre-specified in the method section of this article</i>
	Judgement	<b>Low</b> risk of bias
Other bias	Reported	<i>Comment: Adjusted for clustering effects but no intention-to-treat analysis</i>
	Judgement	<b>Low</b> risk of bias

Pope et al. 1998, Effects of ankle dorsiflexion range and pre-exercise calf muscle stretching on injury risk in Army recruits

Random sequence generation	Reported	<i>"Recruits with surnames commencing with the same letter were equally split between the two platoons"</i>  <i>"Pairs of platoons were then randomly allocated to control and stretch groups for this study"</i>
	Judgement	<b>Low</b> risk of bias
Allocation concealment	Reported	N/A
	Judgement	<b>Unclear</b> risk of bias
Blinding of participants/personnel	Reported	<i>"They were not told which muscle group and injuries the researchers were investigating"</i>  <i>Comment: Control stretching of upper- limb muscles is likely the best possible way to achieve true blinding of subjects</i>
	Judgement	<b>Low</b> risk of bias
Blinding of outcome assessment	Reported	N/A
	Judgement	<b>Unclear</b> risk of bias
Incomplete outcome data	Reported	<i>Comment: 98 from the intervention group and 112 from the control group were either discharged, backsquadded or withdrawn from the study</i>
	Judgement	<b>Low</b> risk of bias
Selective reporting	Reported	<i>Comment: A clinical trials registry study protocol wasn't available but the published reports appear to include all expected outcomes, including those that were pre-specified in the method section of this article</i>
	Judgement	<b>Low</b> risk of bias
Other bias	Reported	<i>Comment: No mention of either adjustment for clustering effects or intention-to-treat analysis</i>
	Judgement	<b>High</b> risk of bias

Pope et al. 2000, A randomized trial of preexercise stretching for prevention of lower-limb injury

Random sequence generation	Reported	<i>"were allocated to stretch or control groups using a blocked, stratified, random allocation procedure"</i>
	Judgement	<b>Low</b> risk of bias
Allocation concealment	Reported	<i>"All allocation procedures to this point were conducted by administrative staff at Kapooka, without regard for the research to be conducted"</i>
	Judgement	<b>Low</b> risk of bias
Blinding of participants/personnel	Reported	<i>Comment: Participants/personnel haven't likely been effectively blinded</i>
	Judgement	<b>High</b> risk of bias
Blinding of outcome assessment	Reported	<i>"The RMO, who was masked to patient allocation, categorized all injuries by area and type"</i>
	Judgement	<b>Low</b> risk of bias
Incomplete outcome data	Reported	<i>"170 (11%; 69 from stretch group, and 101 from the control group) were discharged or transferred to officer training before the end of the training program and without suffering a lower- limb injury"</i>  <i>Comment: Survival analysis was conducted with subject results weighted by number of days of participation</i>
	Judgement	<b>Low</b> risk of bias
Selective reporting	Reported	<i>Comment: A clinical trials registry study protocol wasn't available but the published reports appear to include all expected outcomes, including those that were pre-specified in the method section of this article</i>

	Judgement	<b>Low</b> risk of bias
Other bias	Reported	<i>Comment: Intention-to-treat analysis but no adjustments for clustering effects</i>
	Judgement	<b>High</b> risk of bias

Soderman et al., Balance board training: prevention of traumatic injuries of the lower extremities in female soccer players? A prospective randomized intervention study

Random sequence generation	Reported	<i>"Seven teams (n=121) were randomized to an intervention group and six teams (n=100) to a control group"</i>
	Judgement	<b>Low</b> risk of bias
Allocation concealment	Reported	N/A
	Judgement	<b>Unclear</b> risk of bias
Blinding of participants/personnel	Reported	N/A
	Judgement	<b>Unclear</b> risk of bias
Blinding of outcome assessment	Reported	N/A
	Judgement	<b>Unclear</b> risk of bias
Incomplete outcome data	Reported	<i>"Drop-out in the intervention group (59/121) and control group (22/100)"</i>
	Judgement	<b>High</b> risk of bias
Selective reporting	Reported	<i>Comment: A clinical trials registry study protocol wasn't available and the published reports do not report a total estimate for primary outcomes</i>
	Judgement	<b>High</b> risk of bias
Other bias	Reported	<i>Comment: Exclusion of 1/3 intervention group on the basis of compliance and not because of lack of data</i>
		<i>Comment: Analysis of recurrent injuries</i>
		<i>Comment: RR of 10.96 (2.10-57.3) regarding major injuries indicate that intervention may be detrimental</i>
	Judgement	<b>High</b> risk of bias

Soligard et al., Comprehensive warm-up programme to prevent injuries in young female footballers: cluster randomised controlled trial

Random sequence generation	Reported	<i>"We randomised"</i>
	Judgement	<b>Low</b> risk of bias
Allocation concealment	Reported	<i>"The statistician (IH) who conducted the randomisation did not take part in the intervention"</i>
	Judgement	<b>Low</b> risk of bias
Blinding of participants/personnel	Reported	<i>Comment: Both groups were informed of allocation</i>
	Judgement	<b>High</b> risk of bias
Blinding of outcome assessment	Reported	<i>"At the research centre one physical therapist and one medical student, who were blinded to group allocation, recorded injuries"</i>
	Judgement	<b>Low</b> risk of bias
Incomplete outcome data	Reported	<i>"13 clubs in the intervention group did not start the warm-up programme nor did they deliver any data on injury or exposure"</i>
		<i>"Nineteen clubs in the control group did not provide any data"</i>
		<i>"The dropout rate was similar between the groups (23 (2,1%) vs. 24 (2,9%))"</i>
	Judgement	<b>Low</b> risk of bias
Selective reporting	Reported	<i>Comment: A clinical trials registry study protocol wasn't available but the published reports appear to include all expected outcomes, including those that were pre-specified in the method section of this article</i>

	Judgement	<b>Low</b> risk of bias
Other bias	Reported	<i>Comment: Adjusted by intraclass coefficient and analyzed by intention-to-treat</i>
	Judgement	<b>Low</b> risk of bias

Steffen et al., Preventing injuries in female youth football – a cluster-randomized controlled trial

Random sequence generation	Reported	<i>Comment: Stratified block randomization was described</i>
	Judgement	<b>Low</b> risk of bias
Allocation concealment	Reported	<i>"The statistician (IH) who conducted the randomisation did not take part in the intervention"</i>
	Judgement	<b>Low</b> risk of bias
Blinding of participants/personnel	Reported	<i>Comment: Both groups were informed of allocation</i>
	Judgement	<b>High</b> risk of bias
Blinding of outcome assessment	Reported	<i>"The injury recorders were blinded to which group the teams and injured players belonged to"</i>
	Judgement	<b>Low</b> risk of bias
Incomplete outcome data	Reported	<i>Comment: 18 and 54 players dropped out from the intervention and control group, respectively. The reports on attrition is ambiguous</i>
	Judgement	<b>Low</b> risk of bias
Selective reporting	Reported	<i>Comment: A clinical trials registry study protocol wasn't available but the published reports appear to include all expected outcomes, including those that were pre-specified in the method section of this article</i>
	Judgement	<b>Low</b> risk of bias
Other bias	Reported	<i>"The program was used at 52% of all trainings for the intervention group and the average attendance for these were 60% for each player"</i>  <i>Comment: Both intention-to-treat analysis and clustering effect adjustments were performed</i>
	Judgement	<b>Low</b> risk of bias

Waldén et al., Prevention of acute knee injuries in adolescent female football players: cluster randomised controlled trial

Random sequence generation	Reported	<i>"We used a computer generated list of random numbers to randomise clubs stratified by district, whereby all teams from the same club were assigned to the same group"</i>
	Judgement	<b>Low</b> risk of bias
Allocation concealment	Reported	<i>"One author (IA) who was blinded to the identity of the clubs did the randomisation"</i>
	Judgement	<b>Low</b> risk of bias
Blinding of participants/personnel	Reported	<i>"The coaches, players, and study therapists were not blinded to group allocation"</i>
	Judgement	<b>High</b> risk of bias
Blinding of outcome assessment	Reported	<i>"The coaches, players, and study therapists were not blinded to group allocation, but the study physicians who assessed the primary outcome were"</i>
	Judgement	<b>Low</b> risk of bias
Incomplete outcome data	Reported	<i>"the dropout frequency was 21% (intervention 16% (23/144 clubs), control 26% (38/147))"</i>  <i>"no missing data for analysed clubs"</i>
	Judgement	<b>Low</b> risk of bias
Selective reporting	Reported	<i>Comment: Clinical trials registry study protocol was available and inclusion criteria, intervention, and outcomes corresponded to the reported study of this article</i>
	Judgement	<b>Low</b> risk of bias
Other bias	Reported	<i>Comment: Both adjustment of clustering effects and intention-to-treat were performed.</i>
	Judgement	<b>Low</b> risk of bias

Wedderkopp et al., Prevention of injuries in young female players in European team handball. A prospective intervention study

Random sequence generation	Reported	<i>“Eleven teams with 11 players were randomised to the intervention group and 11 teams with 126 players to the control group”</i>
	Judgement	<b>Low</b> risk of bias
Allocation concealment	Reported	<i>Author correspondance: No blinding</i>
	Judgement	<b>High</b> risk of bias
Blinding of participants/personnel	Reported	<i>Author correspondance: No blinding</i>
	Judgement	<b>High</b> risk of bias
Blinding of outcome assessment	Reported	<i>Author correspondance: No blinding</i>
	Judgement	<b>High</b> risk of bias
Incomplete outcome data	Reported	<i>Comment: Analysis performed on same no. of players as reported were randomized</i>
	Judgement	<b>Low</b> risk of bias
Selective reporting	Reported	<i>Comment: A clinical trials registry study protocol wasn't available but the published reports appear to include all expected outcomes, including those that were pre-specified in the method section of this article</i>
	Judgement	<b>Low</b> risk of bias
Other bias	Reported	<i>Comment: Intention to treat but no mention of adjustment for cluster effects</i>
	Judgement	<b>High</b> risk of bias

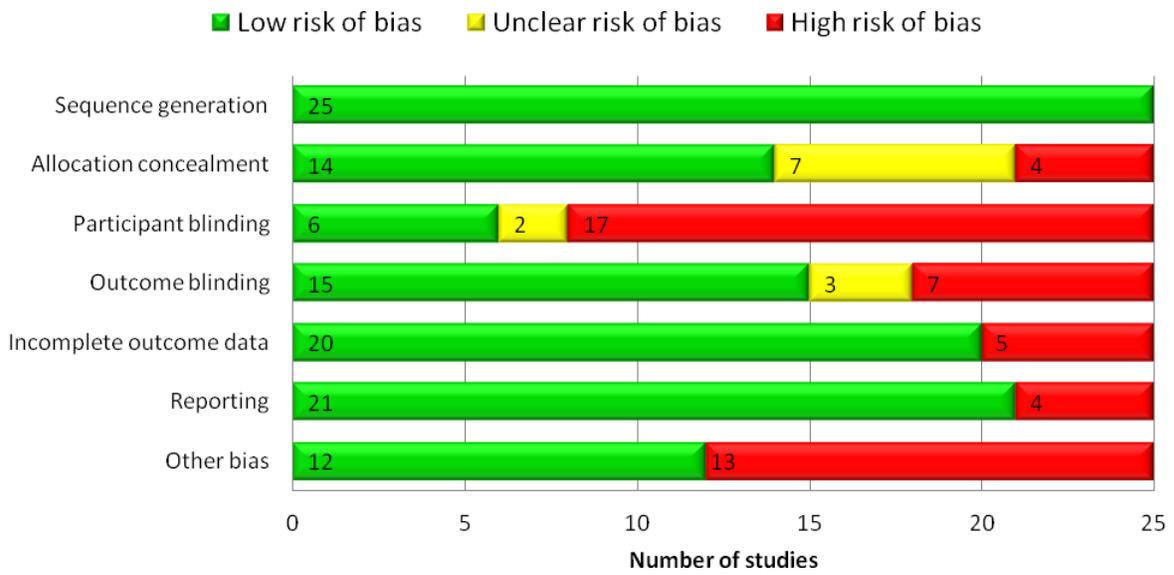

**eTable1, Quality assessment summary**

Total quality assessment 0-14 scale obtained by assigning studies 1 point for unclear and 2 for low

**eFigure2, Quality assessment summary figure**

**eTable2, Characteristics of included studies**

Source/ location	Intervention	Population	Study completion	Follow-up	Outcome	Primary outcome	Remarks
Askling et al. Sweden 2003	<p>- 10-week (16 sessions) preseason hamstring concentric/eccentric strength training.</p> <p>- Performed additional to standardized warm-up programme also performed by controls.</p>	<p>- 30 elite, male soccer players, except goalkeepers, in two teams from the Swedish premier-league division.</p>	<p>- 15 individuals in intervention group with a distribution of eight and seven subjects, from each team respectively.</p> <p>- 15 controls with seven individuals from one team and eight from the other.</p> <p>- No attrition</p>	<p>- Ten weeks preconditioning + one season of eight months.</p>	<p>- 3 injuries in intervention group.</p> <p>- 10 injuries in control group.</p>	<p>- Hamstring injury: Pain by use/palpation + time loss.</p> <p>- Evaluation by therapist and physician.</p> <p>- Injured players were excluded.</p>	<p>- True individual-randomized study, but potential contamination problems could exist</p> <p>- Intention-to-treat analysis.</p> <p>- All players reported having completed all sessions.</p>
Beijsterveldt et al. Netherlands 2013	<p>- 10-15min with ten exercises focusing on core stability, eccentric training of the thighs, proprioception training, dynamic stabilization, and plyometrics with straight leg alignment.</p> <p>- 5 week pre-season familiarisation and full implementation by the start of the season.</p> <p>- Control group did the practice as usual.</p>	<p>- 487 male amateur players, aged 18-40 years.</p>	<p>- 223 players in eleven intervention teams.</p> <p>- 233 players in twelve control teams.</p> <p>- Dropout of one team (21 players) plus 18 individuals in the intervention group and 13 from control group.</p>	<p>- One season of nine months.</p>	<p>- 135 injuries in intervention group.</p> <p>- 139 injuries in the control group.</p>	<p>- All-injury: F-MARC consensus statement definition</p> <p>- Team paramedic or sports trainer recorded injuries.</p>	<p>- Intention-to-treat.</p> <p>- Sample size calculation based on inflation factor estimate but no report of actual cluster adjustments in either study protocol or published report.</p> <p>- 73% compliance.</p>

**eTable2, Characteristics of included studies (continued)**

Source/location	Intervention	Population	Study completion	Follow-up	Outcome	Primary outcome	Remarks
Brushoj et al. Denmark 2008	<p>- 12-week program (three sessions, 15min each, per week) concurrent with start of basic military training. One session composed two strength exercises, three stabilization/ coordination exercises, and one stretching exercise.</p> <p>- Controls did placebo core/upper body exercises with stretch of the pectoral muscles.</p>	<p>- 1020 conscripts, aged 19-26.</p>	<p>- 487 individuals in twelve intervention platoons – attrition of 20</p> <p>- 490 in twelve control teams - attrition 23</p>	<p>- Twelve weeks.</p>	<p>- 50 primary outcome injuries in prevention group.</p> <p>- 48 outcome injuries in control group.</p>	<p>- Knee overuse injury: Pain + unrelated to trauma + specific criteria.</p> <p>- Medical officer and doctor.</p> <p>- Injuries within last month were excluded.</p> <p>- Repeated outcomes not taken into account.</p> <p>- Secondary: Total lower extremity injuries</p>	<p>- 75% training compliance.</p> <p>- True individualized randomization</p> <p>- No intention-to-treat analysis.</p> <p>- True blinding have likely been achieved.</p> <p>- Concurrent training intervention in high risk period for overuse injuries may be detrimental</p>
Coppack et al. United kingdom 2011	<p>- 14 week program concurrent with military training. Seven training lessons/week with four strength exercises + four stretching exercises per training.</p> <p>- Control performed syllabus military warm-up and warm-down for parts of the body irrelevant for anterior knee pain.</p>	<p>- 44 male and female troops (clusters) with 1502 recruits. Aged 17-30y.</p> <p>- 100% of eligible recruits participated.</p>	<p>- 759 individuals in 21 intervention troops.</p> <p>- 743 in 23 control troops.</p> <p>- No attrition.</p>	<p>- 14 weeks</p>	<p>- 10 injuries in intervention group.</p> <p>- 36 injuries in control group.</p> <p>- Cox HR 0,25 (0,13-0,48).</p>	<p>- Overuse anterior knee pain injury: Pain criteria and other knee injuries excludable.</p> <p>- Military medical center and physiotherapist.</p> <p>- Recruits with signs or symptoms of pathologic conditions of the leg</p>	<p>- Study suspended early because of military operational commitments.</p> <p>- Within-cluster correlation was accounted for.</p> <p>- Mean individual compliance rate for the 2 programs was 91%.</p> <p>- Intention-to-treat</p>

						were excluded. - Secondary: Total, acute, and overuse injuries	analysis.

<b>Source/ location</b>	<b>Intervention</b>	<b>Population</b>	<b>Study completion</b>	<b>Follow- up</b>	<b>Outcome</b>	<b>Primary outcome</b>	<b>Remarks</b>
Holmich et al.  Denmark  2010	- Sit-ups, one-leg coordination, iliopsoas stretching, and three concentric, eccentric, and isometric adduction exercises for 13min as integrated part of warm-up.  - Control group performed traditional warm-up	- Amateur football players, 2-5th level.  - 46% of invited teams accepted participation.	- 477 players in 22 intervention clubs.  - 430 players in 22 control clubs  - 12 + 11 clubs withdrew immediately after randomization and further 5 + 6 during the study.	- 42 weeks.	- Corresponding author reported 23 injuries in intervention group and 30 injuries in control group.  - Cox HR 0,69 (0,40-1,19).	- Groin injury: any physical complaint or medical attention.  - Physiotherapist and coach.  - Previous groin injuries included.	- 11 year report delay due to high number of competing tasks.  - Adjusted for intracluster estimate.  - 93% of players presented with full data.  - The intention-to-treat analysis were claimed not to show any differences but weren't reported.
Jamtvedt et al.  Norway/ Australia  2010	- Seven muscle groups in the lower limb and trunk were stretched for at least 14min before and after vigorous activity. Instructions were accessible at website and subjects were asked to stretch for at least 30 sec and until felt strong but not painful stretch.  - Controls were asked not to stretch any lower limb or trunk muscle	2377 participants worldwide, >18 years, English/ Norwegian speaking, vigorous activity $\geq 1$ day(s) a week, and internet access.	- 1079 participants in intervention group.  - 1046 controls.	- Twelve weeks.	- 339 injuries in intervention group and 348 in the control group.  - Cox HR 0,97 (0,84-1,13).	- Lower limb and trunk injuries: internet-based self-reporting.  - Current injuries were excluded.	- Entirely internet-based study design.  - Intention to treat analysis.  - According to self-reports 38,4% and 43,9% of the intervention group complied fully or almost fully to target frequency and duration, respectively.

**eTable2, Characteristics of included studies (continued)**

Source/ location	Intervention	Population	Study completion	Follow-up	Outcome	Primary outcome	Remarks
Olsen et al.  Norway  2005	- 15 consecutive sessions of four exercises for a total of 15-20min every training session and then once a week for the remainder of the season. Comprised of warm-up, technique, balance and strength/power.  - Controls trained as usual.	- 1886, 15-17 year-old, players in 123 handball clubs.  - 85% of eligible were recruited.	- 61 intervention clubs of 958 players.  - 59 control clubs of 879 players.	- One season of eight months.	- 48 injuries in the intervention group.  - 81 injuries in the control group.  - Cox RR 0,53 (0.35-0.81).	- Knee and ankle injury: Time loss.  - Physiotherapists.  - No major injuries at inclusion.	- Intention-to-treat analysis.  - Adjusted for clustering effect.  - 87% compliance to programme.
Pasanen et al.  Finland  2008	- 20-30min of running techniques, balance/body control, plyometric, and strength exercises. Players with lower back control difficulties or flexibility limitation were asked to stretch in addition. Two week introduction and thereafter the players were advised to carry out in own time.  - Control usual warm-up	- 28 teams with 475 female floorball players of elite league, 1 <sup>st</sup> , and 2 <sup>nd</sup> division.  - 86% of eligible players were recruited.	- 14 intervention teams of 256 players.  - 14 control teams of 201 players.	- One season of six months.	- 20 injuries in the intervention group.  - 52 injuries in the control group.  - RR 0,34 (0.20-0.57).	- Non-contact injury: time loss.  - Study doctor followed up on questionnaire reports.  - Previous injuries were included and didn't differ between the two groups.	- Intention-to-treat analysis.  - A mean of 74% of sessions were completed.  - Cluster adjusted by estimation of intracluster correlation

							coefficients. - On average 69% of players attended training.
Petersen et al. Denmark 2011	- Additional ten week progressive Nordic hamstring exercise and maintenance of three sets once a week.  - Controls trained as usual.	- 54 men's soccer teams from the five best leagues in Denmark.	- 23 intervention teams with 461 players.  - 27 control teams with 481 players.  - No dropout.	- Twelve months.	- 12 injuries in intervention group.  - 32 injuries in control group.  - RR 0,41 (0,18-0,93).	- Acute hamstring injury: any physical complaint.  - Medical staff or physiotherapist.  - Previous injuries were included and didn't differ between the two groups.	- 91% compliance to intended training.  - Adjusted for intracluster coefficient.  - Intention-to-treat analysis.

**eTable2, Characteristics of included studies (continued)**

Source/location	Intervention	Population	Study completion	Follow-up	Outcome	Primary outcome	Remarks
Pope et al. Australia 1998	- Two 20sec stretches for gastrocnemius and soleus before strenuous exercise, on average every second day.  - Controls stretched wrist flexors and triceps.	- 1093 male recruits between 17-35 years.	- 549 subjects in 26 intervention platoons.  - 544 subjects in 26 control platoons.  - No attrition.	- Twelve weeks.	- 23 injuries in intervention group.  - 25 injuries in control group.  - Cox HR 0,92 (0,52-1,61).	- Injury definition: >3 days before taking up full duty without symptoms because of tendo-achilles lesion, ankle sprain, stress fracture, periostitis, or anterior tibial compartment pressure syndrome.  - Reporting to medical assistants or nursing staff and diagnosis by medical officer or research physiotherapists.  - Excluded if significant pre-	- 96,7% of eligible recruits consented.  - Analysed by survival analysis.  - No mention of adjustment for clustering effects.  - Intention-to-treat as there

						existing injury.	was no dropout.
Pope et al. Australia 2000	<ul style="list-style-type: none"> <li>- 40 sessions in twelve weeks with a 5min program with 20sec stretches interspersed with 4min warm-up. Six muscle groups of the leg were stretched.</li> <li>- Controls didn't stretch during warm-up.</li> </ul>	<ul style="list-style-type: none"> <li>- 1538 male army recruits in 39 platoons.</li> </ul>	<ul style="list-style-type: none"> <li>- 19 intervention platoons of 666 subjects.</li> <li>- 20 control platoons of 702 subjects.</li> </ul>	<ul style="list-style-type: none"> <li>- Twelve weeks.</li> </ul>	<ul style="list-style-type: none"> <li>- 158 injuries in intervention group.</li> <li>- 175 injuries in control group.</li> <li>- Cox HR 0,95 (0,77-1,18).</li> </ul>	<ul style="list-style-type: none"> <li>- Lower-limb injury: &gt;3 days before taking up full duty without symptoms.</li> <li>- Reporting by medical assistants or nursing staff and diagnosis by medical officer.</li> <li>- Significant injuries were excluded.</li> </ul>	<ul style="list-style-type: none"> <li>- Intention-to-treat analysis.</li> <li>- No mention of adjustments for clustering effects.</li> <li>- No analysis of compliance other than reported training days.</li> </ul>

**eTable2, Characteristics of included studies (continued)**

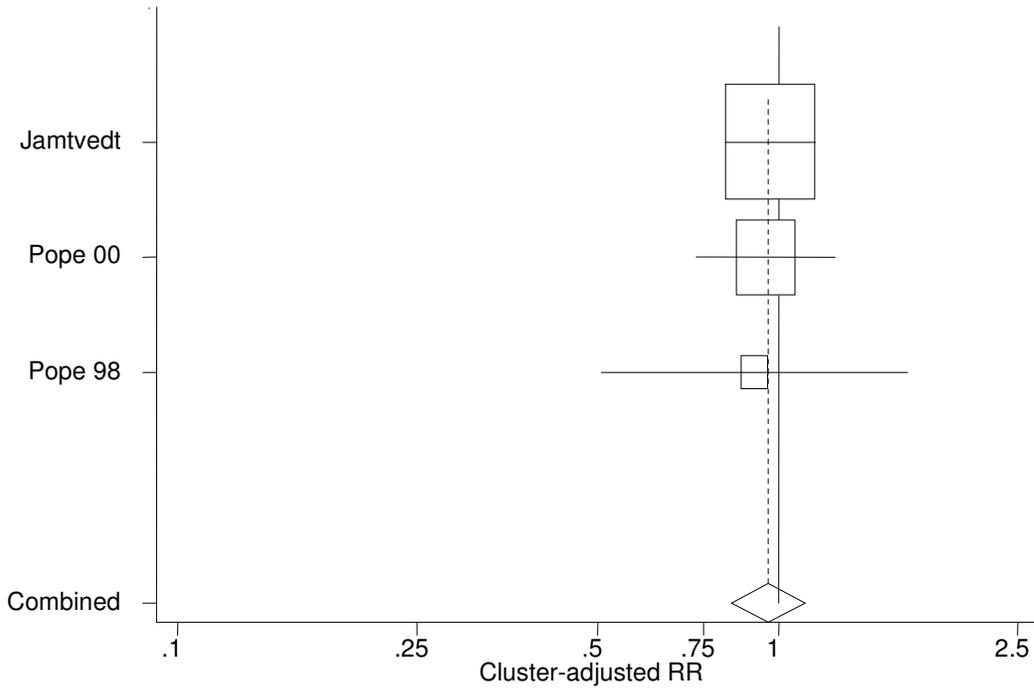

Source/ location	Intervention	Population	Study completion	Follow- up	Outcome	Primary outcome	Remarks
Soderman et al.  Sweden  2000	- 10-15min additional balance board exercises consisting of five progressions of difficulty. Each exercise was carried out three times 15sec for each leg. Initially training each day for 30 days and after this three times per week the rest of the season.  - No description of control group instructions.	- 221 female soccer players from 13 teams in the 2nd and 3rd Swedish division.	- 62 players in seven intervention teams.  - Control 78 players in six teams.  - 27 individuals who didn't complete more than 35 sessions were excluded.	- One season of seven months.	- 28 injuries in intervention group.  - 31 injuries in control group.  - Cox RR 1,24 (0,74-2,06).	- Lower extremity injury: time loss. Reported by players and coaches and diagnosed by authors.  - Recurrent injuries analyzed.	- No cluster adjustment.  - Not analyzed by intention-to-treat.  - Intervention group performed 77% of the planned sessions.  - Cox RR of major injuries 10.96 (2.10-57.3).
Soligard et al.  Norway  2008	- 8min running exercises, 10min of strength/balance/jump exercises, and 2min of football-specific movements before each training and the running exercises before each match.  - Controls performed usual warm-up.	- 2540 female football players in 125 clubs, aged 13-17 years.  - 69% of eligible clubs participated.	- 52 intervention clubs with 1055 players.  - 41 control clubs with 837 players.	- One season of eight months.	- 121 injuries in intervention group.  - 143 injuries in control group.  - Cox RR 0,71 (0,49-1,03).	- Lower extremity injury: time loss.  - Physical therapist and medical student.  - Unknown whether previous injuries were included in analysis.	- Adjusted by intracluster coefficient.  - Intention-to-treat analyses.  - 77% compliance.  - No injury occurred during the execution of the warm-up programme.

**eTable2, Characteristics of included studies (continued)**

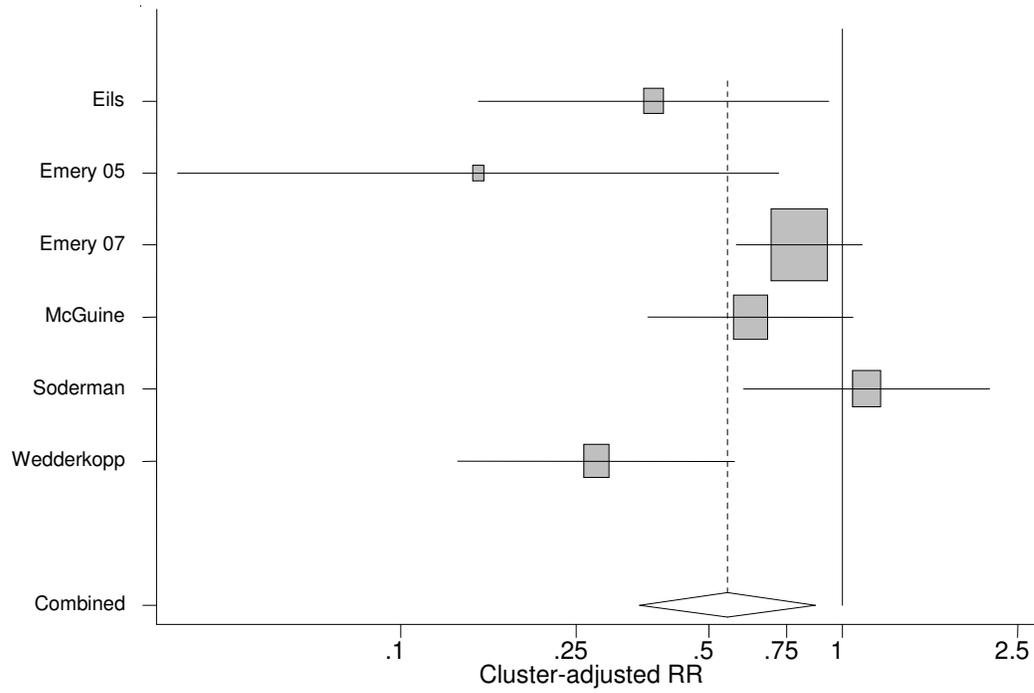

Source/ location	Intervention	Population	Study completion	Follow-up	Outcome	Primary outcome	Remarks
Steffen et al. Norway 2008	<p>- 5min jogging followed by ten exercises focusing on core stability, balance, joint stabilization, and eccentric hamstring strength for about 15min. Performed for 15 consecutive sessions and after that, once a week for the rest of the season.</p> <p>- Controls trained and warmed-up as usual.</p>	<p>- About 2100 female soccer players in 113 teams from Norwegian U17 league.</p> <p>- 72% of eligible clubs participated.</p>	<p>- 1073 players in 58 intervention teams.</p> <p>- 947 players in 51 control teams.</p>	<p>- Two months pre-season + one season of eight months.</p>	<p>- 242 injuries in intervention group.</p> <p>- 241 injuries in control group.</p> <p>- RR 1,0 (0,8-1,2).</p>	<p>- All-injury: time loss.</p> <p>- Physical therapists.</p> <p>- Unknown whether previous injuries were included in analysis.</p>	<p>- Intention-to-treat analyses.</p> <p>- Adjusted for clustering effects.</p> <p>- The program was used at 52% of all trainings for the intervention group and the average attendance for these were 60% for each player.</p>
Waldén et al. Sweden 2012	<p>- 5min low intensity running warm-up and 15min for six neuromuscular exercises program. The six exercises were one legged knee squat, pelvic lift, two legged knee squat, the bench, the lunge, and jump/landing technique two times a week.</p> <p>- Controls trained as usual and teams already did injury prevention were excluded.</p>	<p>- 309 clubs with 4564 female soccer players, 12-17 years.</p> <p>- 75% of eligible clubs participated.</p>	<p>- 121 intervention clubs with 2479 players.</p> <p>- 109 control clubs with 2085 players.</p>	<p>- One season of seven months.</p>	<p>- Intervention group: 7 injuries.</p> <p>- Controls: 14 injuries.</p> <p>- Cox RR 0,36 (0,15-0,85).</p>	<p>- ACL injury: sudden onset time loss.</p> <p>- Study therapists and physicians with access to diagnostic imaging.</p> <p>- Unknown whether previous injuries were excluded.</p>	<p>- Intention-to-treat analysis.</p> <p>- Adjustment for clustering effects performed.</p> <p>- No report of compliance.</p>
