| TITLE                     |           |   |                    |
| Title                     | 1         | Identify the report as a systematic review <i>incorporating a network</i> meta-analysis (or related form of meta-analysis).   | 1                  |
| ABSTRACT                  |           |   |                    |
| Structured<br>summary     | 2         | Provide a structured summary including, as applicable:  Background: main objectives  Methods: data sources; study eligibility criteria, participants, and interventions; study appraisal; and synthesis methods, such as network meta-analysis.  Results: number of studies and participants identified; summary estimates with corresponding confidence/credible intervals; treatment rankings may also be discussed. Authors may choose to summarize pairwise comparisons against a chosen treatment included in their analyses for brevity.  Discussion/Conclusions: limitations; conclusions and implications of findings.  Other: primary source of funding; systematic review registration number with registry name. | 2                  |
| INTRODUCTION              |           | ,   |                    |
| Rationale                 | 3         | Describe the rationale for the review in the context of what is already known, including mention of why a network meta-analysis has been conducted.   | 4                  |
| Objectives  METHODS       | 4         | Provide an explicit statement of questions being addressed, with reference to participants, interventions, comparisons, outcomes, and study design (PICOS).   | 4                  |
| Protocol and registration | 5         | Indicate whether a review protocol exists and if and where it can be accessed (e.g., Web address); and, if available, provide registration information, including registration number.  | 4                  |
| Eligibility criteria      | 6         | Specify study characteristics (e.g., PICOS, length of follow-up) and report characteristics (e.g., years considered, language, publication status) used as criteria for eligibility, giving rationale. Clearly describe eligible treatments included in the treatment network, and note whether any have been clustered or merged into the same node (with justification).  | 5                  |
| Information sources       | 7         | Describe all information sources (e.g., databases with dates of coverage, contact with study authors to identify additional studies) in the search and date last searched.  | 5                  |
| Search                    | 8         | Present full electronic search strategy for at least one database, including any limits used, such that it could be repeated.   | 5                  |
| Study selection           | 9         | State the process for selecting studies (i.e., screening, eligibility, included in systematic review, and, if applicable, included in the meta-analysis).   | 5                  |
| Data collection process   | 10        | Describe method of data extraction from reports (e.g., piloted forms, independently, in duplicate) and any processes for obtaining and confirming data from investigators.  | 5-6                |

| Geometry of the network  Geometry of the network  network  network  Size   |   |                   |           |   |       |
|--|---|-------------------|-----------|---|-------|
| network  network under study and potential biases related to it. This should include how the evidence base has been graphically summarized for presentation, and what characteristics were compiled and used to describe the evidence base to readers.  Risk of bias 12 within individual studies  Summary 13 State the principal summary measures (e.g., risk ratio, difference in means). Also describe the use of additional summary measures assessed, such as treatment rankings and surface under the cumulative ranking curve (SUCRA) values, as well as modified approaches used to present summary findings from meta-analyses.  Planned nethods of analysis  Planned 14 methods of analysis  Planned 15 Describe the methods of handling data and combining results of studies for each network meta-analysis. This should include, but not be limited to:  Handling of multi-arm trials;  Selection of prior distributions in Bayesian analyses; and  Assessment of linconsistency  Assessment of model fit.  Describe the statistical methods used to evaluate the agreement of direct and indirect evidence in the treatment network(s) studied. Describe efforts taken to address its presence when found.  Specify any assessment of risk of bias that may affect the cumulative evidence (e.g., publication bias, selective reporting within studies).  Additional 16 Describe methods of additional analyses if done, indicating which were pre-specified. This may include, but not be limited to, the following:  Sensitivity or subgroup analyses;  Meta-regression analyses;  Meta-regression analyses;  Meta-regression analyses;  Meta-regression analyses;  Meta-regression analyses;  Meta-regression analyses;  Provide a network graph of the included studies to enable visualization of the geometry of the treatment network, and patients for the different interventions and pairwise comparisons in the network, gaps of evidence in the treatment network, and patients for the different interventions and pairwise comparisons in the network, gaps of evidence in the treatment network,  |   | Data items        | 11        | List and define all variables for which data were sought (e.g., PICOS, funding sources) and any assumptions and simplifications made.   | 5-6   |
| within individual studies studies (including specification of whether this was done at the study or outcome level), and how this information is to be used in any data synthesis.  Summary 13 State the principal summary measures (e.g., risk ratio, difference in means). Also describe the use of additional summary measures assessed, such as treatment rankings and surface under the cumulative ranking curve (SUCRA) values, as well as modified approaches used to present summary findings from meta-analyses. Describe the methods of handling data and combining results of studies for each network meta-analysis. This should include, but not be limited to:  • Handling of multi-arm trials; • Selection of variance structure; • Selection of prior distributions in Bayesian analyses; and • Assessment of Inconsistency  Assessment of Inconsistency  Assessment of Describe the statistical methods used to evaluate the agreement of direct and indirect evidence in the treatment network(s) studied. Describe the statistical methods used to evaluate the agreement of direct and indirect evidence in the treatment network(s) studied. Describe the statistical methods used to evaluate the agreement of direct and indirect evidence (e.g., publication bias, selective reporting within studies).  Additional 16 Specify any assessment of risk of bias that may affect the cumulative evidence (e.g., publication bias, selective reporting within studies).  Describe methods of additional analyses if done, indicating which were pre-specified. This may include, but not be limited to, the following:  • Sensitivity or subgroup analyses; • Meta-regression analyses; • Meta-regression analyses; • Meta-regression analyses; • Meta-regression analyses; • Alternative formulations of the treatment network; and Use of alternative prior distributions for Bayesian analyses (if applicable).  RESULTS†  Study selection 17 Give numbers of studies screened, assessed for eligibility, and included in the review, with reasons for exclusions at each stage, ideally with a flow dia |   |                   | S1        | network under study and potential biases related to it. This may include commentary on the abundance of trials and randomized patients for the different interventions and pairwise comparisons in the network, gaps of evidence in the treatment network, and potential biases reflected by the network  |   | network           | <b>S3</b> |   | 10-11 |
| Structure.   |   | network           | <b>S4</b> | network. This may include commentary on the abundance of trials and randomized patients for the different interventions and pairwise comparisons in the network, gaps of evidence in the  | 10-11 |

| Study<br>characteristics                   | 18        | For each study, present characteristics for which data were extracted (e.g., study size, PICOS, follow-up period) and provide the citations.  | 8        |
|--|-----------|---|----------|
| Risk of bias within studies                | 19        | Present data on risk of bias of each study and, if available, any outcome level assessment.   | 10       |
| Results of individual studies              | 20        | For all outcomes considered (benefits or harms), present, for each study: 1) simple summary data for each intervention group, and 2) effect estimates and confidence intervals. <i>Modified approaches may be needed to deal with information from larger networks</i> .  | 10-11    |
| Synthesis of results                       | 21        | Present results of each meta-analysis done, including confidence/credible intervals. In larger networks, authors may focus on comparisons versus a particular comparator (e.g. placebo or standard care), with full findings presented in an appendix. League tables and forest plots may be considered to summarize pairwise comparisons. If additional summary measures were explored (such as treatment rankings), these should also be presented. | 10-11-14 |
| Exploration for inconsistency              | <b>S5</b> | Describe results from investigations of inconsistency. This may include such information as measures of model fit to compare consistency and inconsistency models, <i>P</i> values from statistical tests, or summary of inconsistency estimates from different parts of the treatment network.   | 10-11    |
| Risk of bias across studies                | 22        | Present results of any assessment of risk of bias across studies for the evidence base being studied.   | 10-11    |
| Results of additional analyses  DISCUSSION | 23        | Give results of additional analyses, if done (e.g., sensitivity or subgroup analyses, meta-regression analyses, alternative network geometries studied, alternative choice of prior distributions for Bayesian analyses, and so forth).   | 10-11    |
| Summary of evidence                        | 24        | Summarize the main findings, including the strength of evidence for each main outcome; consider their relevance to key groups (e.g., healthcare providers, users, and policy-makers).   | 16-17    |
| Limitations                                | 25        | Discuss limitations at study and outcome level (e.g., risk of bias), and at review level (e.g., incomplete retrieval of identified research, reporting bias). Comment on the validity of the assumptions, such as transitivity and consistency. Comment on any concerns regarding network geometry (e.g., avoidance of certain comparisons).  | 18       |
| Conclusions                                | 26        | Provide a general interpretation of the results in the context of other evidence, and implications for future research.   | 18       |
| FUNDING                                    |           |   |          |
| Funding                                    | 27        | Describe sources of funding for the systematic review and other support (e.g., supply of data); role of funders for the systematic review. This should also include information regarding whether funding has been received from manufacturers of treatments in the network and/or whether some of the authors are content experts with professional conflicts of interest that could affect use of treatments in the network.                        | 19       |

PICOS = population, intervention, comparators, outcomes, study design.

<sup>\*</sup> Text in italics indicates wording specific to reporting of network meta-analyses that has been added to guidance from the PRISMA statement.

<sup>†</sup> Authors may wish to plan for use of appendices to present all relevant information in full detail for items in this section.

#### Supplement B. Difference between protocol and review

We extracted some important intervention details as suggested by the TIDieR checklist <sup>1</sup> in order to create consistent nodes, however, the poor reporting of included trials prevent the full reporting of their descriptions. We summarized some items in Table 1 of **Supplement E** (Assessment of transitivity) and full details are reported in the online repository OSF at the following link https://osf.io/q24xh.

We transparently edit the nodes according to the statement declaration in the published protocol <sup>2</sup>. For instance, we build a new subgroup category "heat wrap" separated from "physical therapy" category. We also noted that "physical therapy" is represented only by TENS improving the homogeneity of treatment's node. Then, we merged "Inert treatment" (e.g., placebo drug, sham therapy) and "No treatment" since only one study (Malmivaara 1995) reported no intervention in this control group described as: "the continuation of ordinary activities as tolerated."

# **Supplement D. Interventions and Nodes**

# Box 1. Planned description interventions

| Class<br>Pharmacological       | Example of individual treatments   |
|--------------------------------|--|
| Antidepressant drugs           | Any kind of SSRI/SNRI or tryciclic drug  |
| Muscle relaxants drugs         | Any kind of skeletal muscle relaxant drug (e.g. flupirtin, orphenadrine, dantrolene, carisoprodol, tizanidine, incobotulinumtoxinA, cyclobenzaprine, metaxalone, baclofen, methocarbamol, chlorzoxazone)   |
| Non-steroidal anti-            | Any kind of NSAIDs drug, including COX-2 inhibitors (e.g. ibuprofen, naproxen,   |
| inflammatory drugs (NSAIDs)    | sulindac, ketoprofen, tolmetin, etodolac, fenoprofen, diclofenac, flurbiprofen, piroxicam, ketorolac, indomethacin, meloxicam, nabumetone, oxaprozin mefenamic acid, diflunisal)   |
| Opiod drugs                    | Any kind of strong or weak opiod analgesics (e.g. morphine, hydromorphone, oxycodone, fentanyl, methadone, buprenorphine, diamorphine, tapentadol, codeine, hydrocodone, tramadol, pentazocine, tilidine)  |
| Paracetamol                    |  |
| Steroids                       | Any kind of steroid drug (e.g dexamethasone, methylprednisolone, prednisone)   |
| Non-pharmacological            |  |
| treatments                     |  |
| Acupuncture and dry needling   |  |
| Biopsychosocial rehabilitation | Any kind of cognitive behavioral treatment, multidisciplinary biopsychological rehabilitation and back school  |
| Education                      | Any kind of advice to stay active, booklet, reassurance, ergonomics, workplace intervention, pain education (neurobiology and neurophysiology of pain)   |
| Exercise                       | Any kind of exercise (aerobic or resistance training) single supervised or home exercise, including stretching and McKenzie therapy  |
| Manual therapy                 | Any kind of mobilization or spinal manipulation (high velocity thrust techniques at or near to the end of the range of motion or low-grade velocity movements within the range of motion), myofascial therapy/trigger point, soft tissue massage |
| Physical Therapy               | Any physical therapy (low-laser therapy, diathermy, transcutaneous electrical nerve stimulation, ultrasound therapy, heat wrap)  |
| Taping                         | Kinesiotaping  |
| Usual care                     | Any kind of treatment suggested by general medicine (minimal intervention: advice to stay active or to take drugs as needed)   |
| Inert treatment                | Any kind of sham or placebo therapy  |
| No treatment                   | No treatment, waiting list control   |

### Box 2. Nodes

| Treatments  Muscle relaxant drugs (Baclofen, Carisoprodol, Dantrolene, Tizanidine Thiocolchicoside)  Non-Steroidal Anti-Inflammatory Drugs | Nodes<br>Muscle<br>relaxant<br>NSAIDs | Evidence and assumptions Separate assessment for muscle relaxants and for Benzodiazepines <sup>3</sup> .  A metanalysis shown similar effects across muscle relaxant drugs versus placebo, l <sup>2</sup> =55% <sup>4</sup> .  Separate assessment for all NSAIDs <sup>3</sup> .  |
|--|---------------------------------------|---|
| (NSAIDs), including COX-2 inhibitors (diclofenac, diflunisal, ibuprofen, indomethacin, loxoprofen, piroxicam, tenoxicam)                   |                                       | No clear difference in short-term pain reduction when comparing selective COX-2 inhibitors to non-selective NSAIDs <sup>5</sup> .   |
| Opioid analgesics (meptazinol)   | Opioids                               | Separate assessment for opiods <sup>3</sup> . Inclusion criteria of SR: morphine, diamorphine, fentanyl, alfentanil, remifentanil, methadone, oxycodone, pethidine, tapentadol, tramadol, codeine, dihydrocodeine, meptazinol) <sup>6</sup> . Inclusion criteria of SR: various opioid analgesics <sup>7</sup> .  |
| Paracetamol  | Paracetamol                           | Separate assessment for paracetamol <sup>38</sup> .   |
| Steroids drugs (dexamethasone, methylprednisolone, prednisone)   | Steroids                              | Separate assessment for steroids <sup>3</sup> . Systematic reviews found no evidence to suggest that a series of epidural injections was any more effective than a single injection (see Appendix 1 Table 3). Individual RCTs found no evidence of improvement in steroid benefits with increasing dose (see Appendix 1 Table 4) <sup>9</sup> . Individual RCTs found no consistent evidence of superior efficacy of one steroid over the others (see Appendix 1 Table 4) <sup>9</sup> . A meta-analysis included all type of steroids. <sup>10</sup> . |
| Acupuncture  | Acupuncture                           |   |
| Cognitive behavioural treatment/multidisciplinary biopsychological rehabilitation (MBR) with or without exercise                           |                                       | Inclusion criteria of Cochrane review, MBR program: the intervention included a physical component (e.g., pharmacological, physical therapy, exercise) in combination with either a psychological, social, or occupational component (or any combination of these) <sup>11</sup> .  |
| Back school  | Back school *                         | e   |
| Booklet, Information, ergonomics, any kind of advice, workplace intervention, pain education   | Education                             | Findings suggest positive effects for education even if differ in terms of its contents such as health education, self-management, video education, and postural education <sup>12</sup> .  |
|  |                                       |   |

|  |                     | Many different types of patient education are widely used <sup>13</sup> .   |
|--|---------------------|---|
| McKenzie Any kind of exercise (aerobic or resistance training)                                     | Exercise            | No superior type of physical exercise for people with chronic non-specific neck pain <sup>14</sup> .  Various exercise training approaches are effective <sup>15</sup> .  |
| Stretching   |                     |   |
| Manual therapy (mobilization)  Trigger point/myofascial therapy/massage                            | Manual<br>therapy   | Inclusion crtieria of SR: Studies investigating manual therapy using HVLA or non-HVLA techniques such as: joint mobilization, soft tissue focused techniques, myofascial release, longitudinal sliding, soft tissue mobilizations, deep-pressure massage, muscle energy, massage, hold relaxation technique, ischemic compression, and functional/fascial technique. therapy technique(s) <sup>16</sup> .  Different forms of manual therapy did not lead to different outcomes in older persons with chronic LBP <sup>17</sup> . |
| Heat wrap  | Heat wrap**         |   |
| TENS   | Physical<br>therapy |   |
| Usual care or minimal treatment (general prescription such as drugs as needed, advice stay active) | Usual care          | Usual care is a term used to describe the full spectrum of patient care practices in which clinicians have the opportunity (which is not necessarily seized) to individualize care <sup>18</sup> . Treatment reported: education and reassurance, exercise, bed rest, return to work <sup>19</sup> .  |
| Sham therapy<br>Placebo therapy<br>No treatment  | Inert treatment     |   |
|  |                     |   |

<sup>\*</sup> This node was assessed only in the qualitative synthesis because of insufficient data (e.g., not reported outcome data)

<sup>\*\*</sup>According to the protocol <sup>2</sup> since we obtained a sufficient number of studies sharing the same description of the intervention, we created a new node (heat wrap) separated from the physical therapy node.

## **Supplement E. Assessment of transitivity**

Before conducting the statistical analysis, we assessed whether the trials included in the NMA were on average similar in terms of characteristics that might modify the treatment effect (so that the transitivity assumption is plausible). Indirect comparisons, in contrast to direct comparisons, are not protected by randomisation and may be confounded by differences between the trials. In our analysis we deemed the following parameters as possible confounders <sup>20</sup> which were displayed as cumulative frequencies, boxplots or bar charts when appropriate: stage of NS-LBP, presence of leg pain or sciatica, mean age, percentage of male participants, baseline severity, length of treatment, number of randomized, psychological assessment. The plausibility of the transitivity assumption was evaluated by comparing the distribution of these potential effect modifiers across trials, interventions and heah-to-head comparisons

# Assessment of transitivity by trials

| 0         | 33,3            | 22,2  | 44,4       |  |  |  |  |  |  |

**Legend**: A=Inert treatment; B=Acupuncture; C=Back school; D=Cognitive behavioral therapy; E=Education; F=Exercise; G=Heat wrap; H=Manual therapy; I=Muscle relaxant; J=NSAIDs; K=Opioids; L=Paracetamol; M=Physical therapy; N=Steroids; O=Usual care

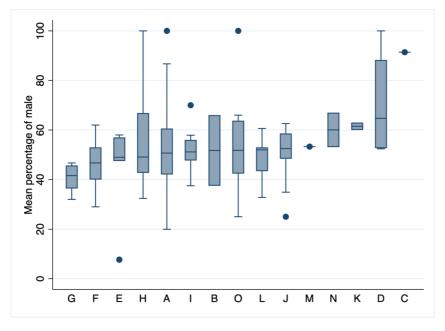

<sup>\*</sup>Presence of leg pain or sciatica was reported in 15 studies out of 46 (31%) of which 6 were not included in quantitative analysis (qualitative analysis).

<sup>\*</sup>Leg pain or sciatica is present in 32% (median, IQR 5-45%) of studies whereas 17% of studies did not report information (median, 0-33%).

Median age ranged from 35 to 48 years old with overlapping of 25-75 percentiles across interventions as already known by the Global Burden of Disease. <sup>21</sup>

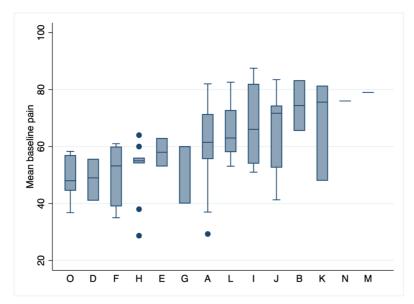

Figure 1. Mean age

Median percentage of male ranged from 42% to 90% with overlapping of 25-75 percentiles across interventions.\*

Figure 2. Percentage of male participants

\*Five studies did not report geder; outliers referts to 2 studies with a 100% male; however, these trials did not report outcome data and were not included in quantitative analysis (qualitative analysis). Excluding them, male and female can be equally distributed across interventions.

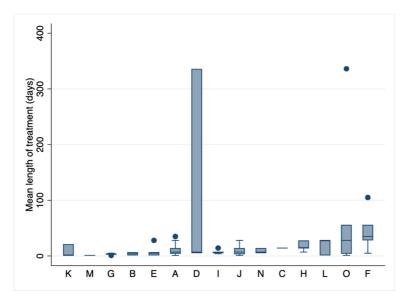

Median baseline pain ranged from 37 to 78 with overlapping of 25-75 percentiles across interventions.

Figure 3. Baseline severity (pain)

<sup>\*\*</sup>H: 1 trial out of 12 had an outlier mean baseline value of 28.7, however this trail did not report outcome data and was not included in quantitative analysis (qualitative analysis)

Severity of pain based on adapted scale 0-100

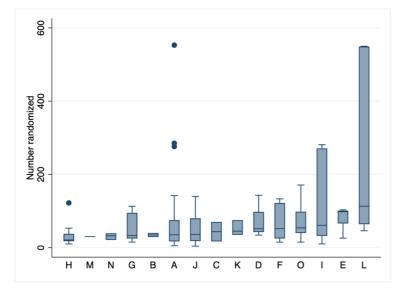

Median length of treatment ranged from 1 to 40 days with overlapping of 25-75 percentiles across interventions.

Figure 4. Length of treatment

\*D: 1 trial out of 4 had an outlier mean length of treatment of 336 days, however this trail did not report outcome data and was not included in quantitative analysis (qualitative analysis); \*\*O: 1 trial had out of 9 an outlier median length of treatment of 336 days, however this trail did not report outcome data and was not included in quantitative analysis (qualitative analysis)

<sup>\*</sup>A: 1 trial out of 34 had an outlier mean baseline value of 29.3, however this trail did not report outcome data and was not included in quantitative analysis (qualitative analysis);

Median number of randomized ranged from 30 to 90 with overlapping of 25-75 percentiles across interventions.

#### Figure 5. Number of randomized

**Legend**: A=Inert treatment; B=Acupuncture; C=Back school; D=Cognitive behavioral therapy; E=Education; F=Exercise; G=Heat wrap; H=Manual therapy; I=Muscle relaxant; J=NSAIDs; K=Opioids; L=Paracetamol; M=Physical therapy; N=Steroids; O=Usual care

<sup>\*</sup>L: 1 trial out of 4 had an outlier number of randomized of 550, which represents less than 5% of the overall sample. However, we judged this reason insufficient to affect transitivity across interventions.

<sup>\*\*</sup>A: 1 trial out of 34 had an outlier number of randomized of 545, which represents less than 5% of the overall sample. However, we judged this reason insufficient to affect transitivity across interventions.

#### Table 4. Pshycological assessment

Overall, 10 RCTs (22%) reported a psychological assessment as baseline characteristics of samples. We found heteroegeneity and poor reporting in outcome measurements with missing data; thus, we did not explore the heterogeneity across all included studies. We reported the phsychological assessment in a table format.

| PSYCH | OLOGICAL ASSESSMENT |                              |   |                          |
|-------|---------------------|------------------------------|---|--------------------------|
| ID    | Author              | Category of Intervention     | Scores at baseline                        | Mean (SD)                |
| 4     | Bertalanffy 2005    | Physical therapy             | Anxiety score <sup>a</sup>                | 82,0 (8,0)               |
| 4     | Bertalanffy 2005    | Inert treatment              | Anxiety score <sup>a</sup>                | 85,0 (6,0)               |
| 6     | Cherkin 1996        | Education                    | Worry about pain <sup>b</sup>             | 6,0                      |

**Legend**: A=Inert treatment; B=Acupuncture; C=Back school; D=Cognitive behavioral therapy; E=Education; F=Exercise; G=Heat wrap; H=Manual therapy; I=Muscle relaxant; J=NSAIDs; K=Opioids; L=Paracetamol; M=Physical therapy; N=Steroids; O=Usual care

DO: 50% was due to 2 studies (Lindstrom 1995 and Storheim 2003)

DF: 100% was due to 1 study (Storheim 2003)

FO: 33% was due to 1 study (Storheim 2003)

Generally, covariates were equally distributed acrosss comparisons except for a very little percentage of comparisons (0.09%) represented by subacute population.

Moreover, these comparisons are present only in medium and long-terms of follow-ups:

- For both pain and disability at medium term no NMA was performed due to a disconnected network;
- For pain at long term, subacute population is present in 1 out of 4 head-to head comparisons;
- For disaibility at long term, subacute population is present in 3 out 5 head-to head comparisons.

Moreover, there is no consensus on the time-contingent traditional classification (acute, subacute, chronic) because this classification does not adequately reflect the prognostically highly important process of chronification <sup>22</sup>. For all these reasons, stage of pain can not be considered a potential effect modifier.

<sup>\*</sup>only 3 comparisons investigated subacute population:

Table 6. Presence of leg pain or sciatica

|             | F     | REQUENCIES | (%)        |

**Legend**: A=Inert treatment; B=Acupuncture; C=Back school; D=Cognitive behavioral therapy; E=Education; F=Exercise; G=Heat wrap; H=Manual therapy; I=Muscle relaxant; J=NSAIDs; K=Opioids; L=Paracetamol; M=Physical therapy; N=Steroids; O=Usual care

Presence of leg pain or sciatica was reported in 15 studies out of 46 (31%) of which 6 were not included in quantitative analysis.

Overall, a very little percentage of leg pain or sciatica (0.09%) impact on global assessment.

<sup>\*</sup>AE: 1 study

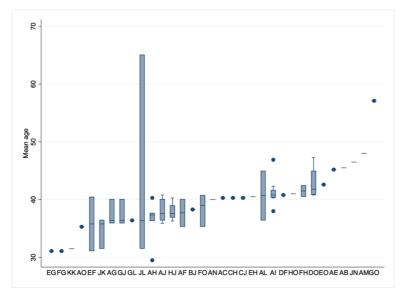

<sup>\*</sup>AF: 2 studies, of which 1 was not included in quantitative analysis (qualitative analysis).

 $<sup>^{*}\</sup>text{EO}\textsc{:}\ 1$  study not included in quantitative analysis (qualitative analysis).

<sup>\*</sup>BJ: 1 study

<sup>\*</sup>AO: 1 study not included in quantitative analysis (qualitative analysis).

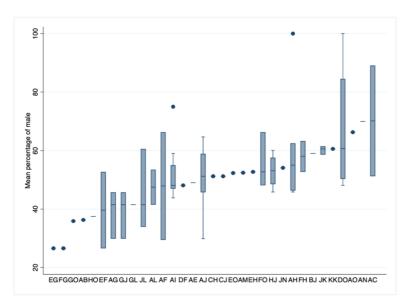

<sup>\*</sup>FO: 2 studies of which 1 was not included in quantitative analysis (qualitative analysis).

Median of mean age ranged from 32 to 57 years old as already known by the Global Burden of Disease <sup>21</sup>

Figure 6. Mean age

\*JL: 1 out of 3 trials has a mean age of 65.1

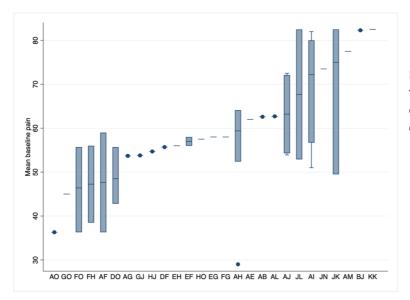

Median percentage of male ranged from 27 to 70 percent with overlapping of 25-75 percentiles across comparisons.

Figure 7. Percentage of male participants

\*Five studies did not report gender

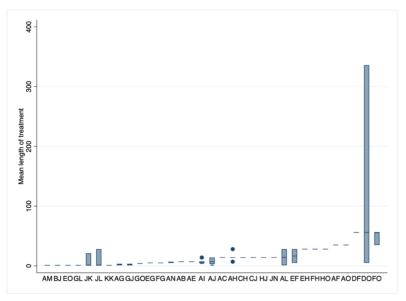

\*\*AH and DO: outliers refer to 2 studies with a 100% male; however, these trials did not report outcome data and were not included in quantitative analysis (qualitative analysis). Excluding them, male and female can be equally distributed across interventions.

Median baseline pain ranged from 37 to 82 with overlapping of 25-75 percentiles across comparisons.

Figure 8. Baseline severity (pain)

\*AH: 1 trial had an outlier mean baseline value of 29, however this trail did not report outcome data and was not included in quantitative analysis (qualitative analysis)

Median length of treatment ranged from 1 to 40 days with overlapping of 25-75 percentiles across comparisons.

Figure 9. Length of treatment

\*DO: 1 trial had an outlier mean lenght of treatment of 336 days, however this trail did not report outcome data and was not included in quantitative analysis (qualitative analysis)

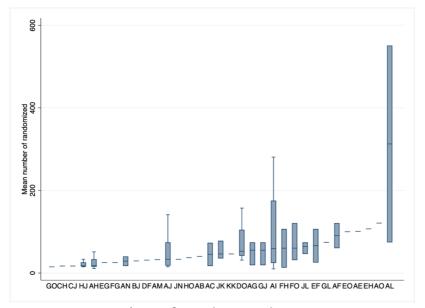

Figure 10. Number of randomized

\*AL: 1 trial had an outlier number of randomized of 550, which represents less than 5% of the overall sample. However, we judged this reason insufficient to prejudice transitivity across interventions.

**Legend**: A=Inert treatment; B=Acupuncture; C=Back school; D=Cognitive behavioral therapy; E=Education; F=Exercise; G=Heat wrap; H=Manual therapy; I=Muscle relaxant; J=NSAIDs; K=Opioids; L=Paracetamol; M=Physical therapy; N=Steroids; O=Usual care

## **Supplement G. Network Plots**

# Figure 1. Network Plot- Pain outcome

**Note:** The size of the nodes is proportional to the number of studies evaluating each intervention, and the thickness of the edges is proportional to the precision (the inverse of the variance) of each direct comparison.

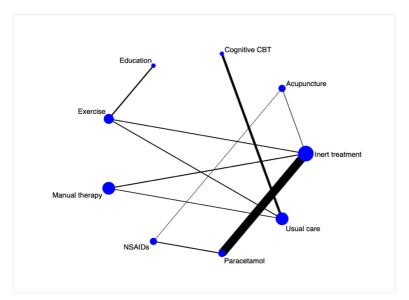

Figure 1a. Network for pain outcome at 1 month of FU

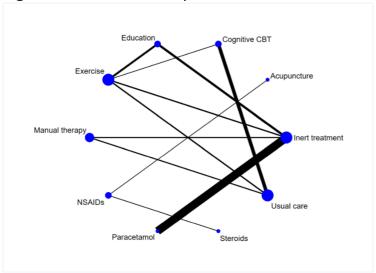

Figure 1b. Network for pain outcome at 3-6 months of FU

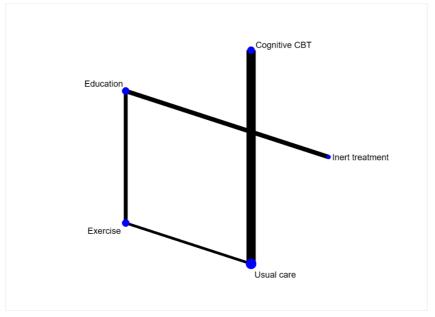

Figure 1c. Network for pain outcome at 12 months of FU

### Figure 2. Network Plot- Disability outcome

**Note:** The size of the nodes is proportional to the number of studies evaluating each intervention, and the thickness of the edges is proportional to the precision (the inverse of the variance) of each direct comparison.

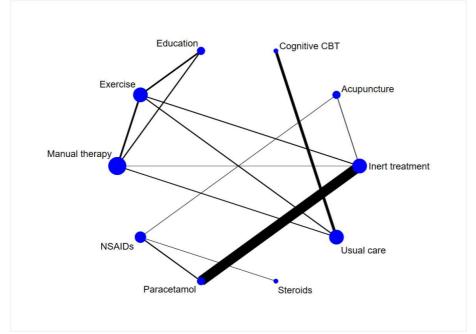

Figure 2a. Network for disability outcome at 1 month of FU

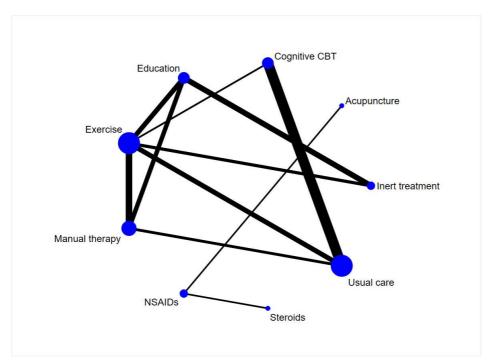

Figure 2b. Network for disability outcome at 3-6 months of FU

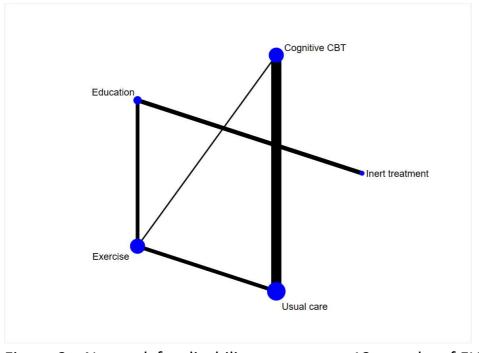

Figure 2c. Network for disability outcome at 12 months of FU

### **Supplement H. Assessment of pairwise Meta-Analyses**

Pairwise meta-analyses –Pain Outcome

Table 1. Pairwise meta-analyses at 1 week of FU for pain

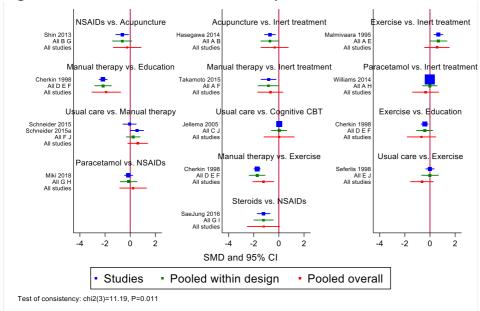

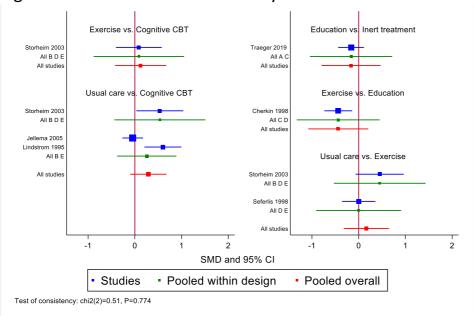

Figure 6. Network forest – disability outcome 12 months

### **Supplement J. Incoherence estimation and evaluation**

Table 1. Estimated Global Inconsistency in Networks

| OUTCOME    | FOLLOW UP  | Chi square      | Prob > chi2           | tau   |
|------------|------------|-----------------|-----------------------|-------|
| PAIN       | 1 week     | chi2 (7) = 9.48 | Prob > chi2 = 0.5383  | 0.234 |
|            | 1 month    | chi2 (2) = 2.05 | Prob > chi2 = 0.3583  | 0.169 |
|            | 3-6 months | disconnected    |                       | -     |
|            | 12 months  | chi2 (1) = 0.00 | Prob > chi2 = 1**     | 0.1   |
| DISABILITY | 1 week     | chi2 (8) =28.66 | Prob > chi2 = 0.0004* | -     |
|            | 1 month    | chi2 (3) =11.20 | Prob > chi2 = 0.0107* | -     |
|            | 3-6 months | disconnected    |                       | -     |
|            | 12 months  | chi2 (2) = 0.51 | Prob > chi2 = 0.7737  | 0.097 |

<sup>\*</sup> Global consistency is tested here using the 'design-by-interaction' test that infers consistency across an entire treatment network, using a chi square test. A p value <0.05 is taken to infer evidence of global inconsistency in the network. 24 25

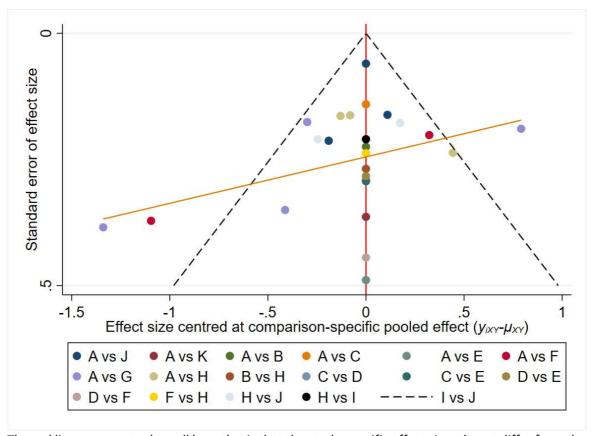

Figure 4. Cumulative ranking curve of disability 12 months

#### **Supplement N. Funnel Plot**

Funnel plot asymmetry was used to assess publication bais containing 10 or more trials reporting the outcome of interest. Thus, this was possibile only for pain and disability outcomes at 1 week and 1 month of follow-up.

Figure 1. Funnel plot-pain

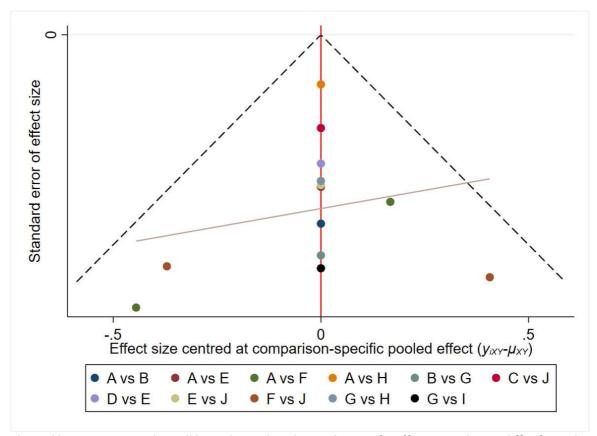

The red line represents the null hypothesis that the study-specific effect sizes do not differ from the respective comparison-specific pooled effect estimates. The orange line is the regression line.

## Figure 1a. Contribution matrix for the network on interventions Pain Outcome 1 week

Label: direct comparisons in the network are presented in the columns, and their contributions to the combined treatment effect are presented in the rows. The entries of the matrix are the percentage weights attributed to each direct comparison. The intervention labels are: A (reference): Inert treatment; B:Acupuncture; C: Education; D: Exercise; E: Heat wrap; F: Manual therapy; G: Muscle relaxant; H: NSAIDs; I: Opioid; J: Paracetamol; K: Physical therapy

## **Supplement P. GRADE for Pain Outcome**

#### Introduction

CINeMA<sup>26</sup> considers 6 domains: (i) within-study bias, (ii) reporting bias, (iii) indirectness, (iv) imprecision, (v) heterogeneity, and (vi) incoherence. Features include the percentage contribution matrix, relative treatment effects for each comparison, estimation of the heterogeneity variance, prediction intervals, and tests for the evaluation of the assumption of coherence. In evaluating imprecision, heterogeneity, and incoherence, we consider the impact of these components of variability in forming clinical decisions.

#### Table of reasons for downgrading

We use the CINeMA software for GRADE assessment.<sup>26</sup> <sup>27</sup> We downgrade network estimate according to the following criteria.

- (1) Study limitations: We downgraded by one level when the contributions from low RoB comparisons were less than 25% and contributions from moderate or high RoB comparisons were 75% or greater.
- (2) Imprecision: We considered a clinically meaningful threshold for SMD to be 0.5 <sup>28</sup> and downgraded the estimate if the SMD point estimate is 0 or more and the lower limit of its CrI is below 0.5; or if the SMD point estimate is less than 0 and the upper limit of its CrI is above 0.5.
- (3) Inconsistency: We rated two concepts, heterogeneity and incoherence (inconsistency), in this domain.

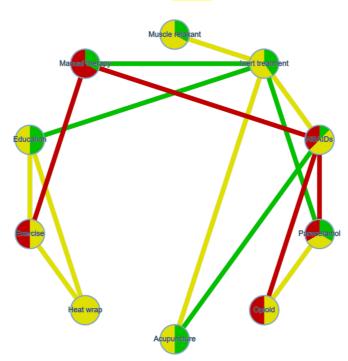

For heterogeneity, we looked at the common tau and found that it is low compared to the expected value as reported in the literature, <sup>29</sup> so we did not downgrade any network estimate for heterogeneity. For inconsistency, we looked at the results of side splitting and we downgraded the comparisons with important inconsistency (p<0.10), where we have not downgraded for imprecision (we did not downgrade the same network estimate for both imprecision and inconsistency).

- (4) Indirectness: We have assured transitivity in our network by limiting the included studies to acute and subacute population and to non-mixed treatments for NS-LBP. Thus, we did not downgrade for indirectness.
- (5) Reporting bias: We cannot completely rule out the possibility that some studies are still missing. However, we assumed that publication bias was undetected.

## 1) Pain at 1 week

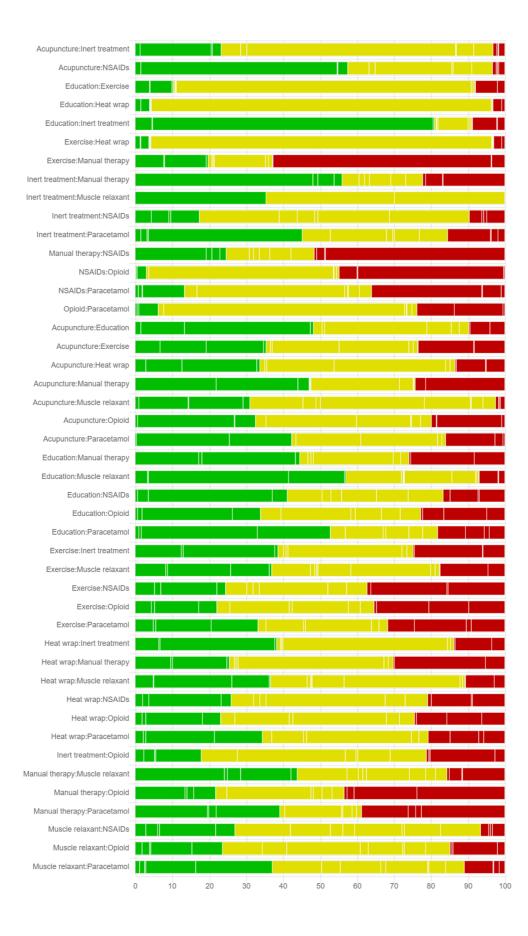

#### 1) Summary of study limitations of the included studies

The colours in the circles indicate the percentage of low RoB studies [green], moderate RoB studies [yellow] and high RoB studies [red] involving each intervention. The colours of the line then indicate the average RoB assessment of each comparison based on the above information – low RoB comparison [green], moderate RoB comparison [yellow] and high RoB comparison [red].

#### 2) Contribution of low or moderate RoB comparisons to each network estimate

Based on the above assessment of RoB for each comparison and the contribution matrix detailing contribution of each direct comparison to all network estimates, the following bar graphs show the percentage of low or moderate RoB contributions for each network estimate. The judgements about study limitations in each direct comparison is shown at the beginning of the graph. Each bar corresponds to a NMA relative treatment effect and shows how much information comes from comparisons at moderate risk of bias [yellow].

### 3) Summary grading of Evidence

#### 2) Pain at 1 month

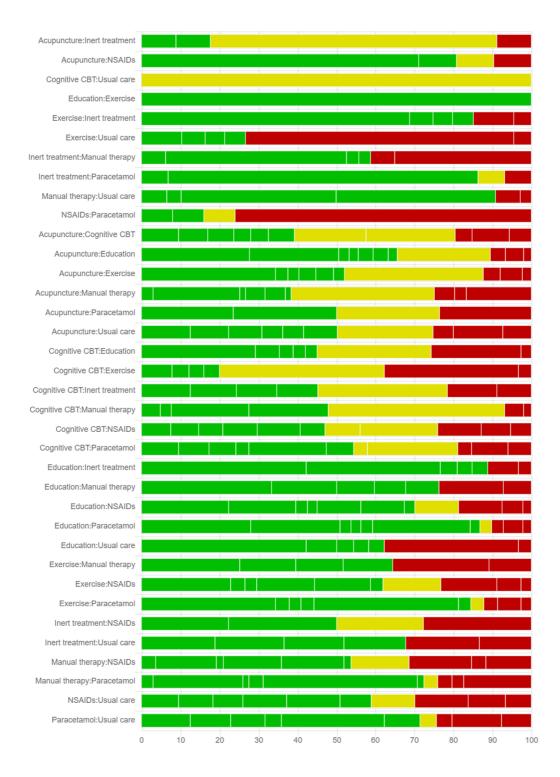

#### 1) Summary of study limitations of the included studies

The colours in the circles indicate the percentage of low RoB studies [green], moderate RoB studies [yellow] and high RoB studies [red] involving each intervention. The colours of the line then indicate the average RoB assessment of each comparison based on the above information – low RoB comparison [green], moderate RoB comparison [yellow] and high RoB comparison [red].

#### 2) Contribution of low or moderate RoB comparisons to each network estimate

Based on the above assessment of RoB for each comparison and the contribution matrix detailing contribution of each direct comparison to all network estimates, the following bar graphs show the percentage of low or moderate RoB contributions for each network estimate. The judgements about study limitations in each direct comparison is shown at the beginning of the graph. Each bar corresponds to a NMA relative treatment effect and shows how much information comes from comparisons at moderate risk of bias [yellow].

### 3) Summary grading of Evidence

## 3) Pain at 12 months

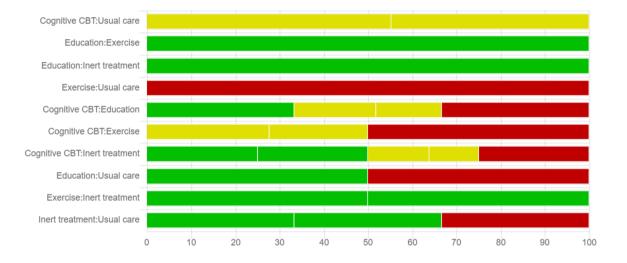

#### 1) Summary of study limitations of the included studies

The colours in the circles indicate the percentage of low RoB studies [green], moderate RoB studies [yellow] and high RoB studies [red] involving each intervention. The colours of the line then indicate the average RoB assessment of each comparison based on the above information – low RoB comparison [green], moderate RoB comparison [yellow] and high RoB comparison [red].

#### 2) Contribution of low or moderate RoB comparisons to each network estimate

Based on the above assessment of RoB for each comparison and the contribution matrix detailing contribution of each direct comparison to all network estimates, the following bar graphs show the percentage of low or moderate RoB contributions for each network estimate. The judgements about study limitations in each direct comparison is shown at the beginning of the graph. Each bar corresponds to a NMA relative treatment effect and shows how much information comes from comparisons at moderate risk of bias [yellow].

### 3) Summary grading of Evidence

|                     | Number of | Within-     |                |              |               |               |             | Confidence |

## **Supplement Q. GRADE for Disability Outcome**

#### Introduction

CINeMA considers 6 domains: (i) within-study bias, (ii) reporting bias, (iii) indirectness, (iv) imprecision, (v) heterogeneity, and (vi) incoherence. Features include the percentage contribution matrix, relative treatment effects for each comparison, estimation of the heterogeneity variance, prediction intervals, and tests for the evaluation of the assumption of coherence. In evaluating imprecision, heterogeneity, and incoherence, we consider the impact of these components of variability in forming clinical decisions.

#### Table of reasons for downgrading

We use the CINeMA software for GRADE assessment.<sup>26</sup> <sup>27</sup> We downgrade network estimate according to the following criteria.

- (1) Study limitations: We downgraded by one level when the contributions from low RoB comparisons were less than 25% and contributions from moderate or high RoB comparisons were 75% or greater.
- (2) Imprecision: We considered a clinically meaningful threshold for SMD to be 0.5 <sup>28</sup> and downgraded the estimate if the SMD point estimate is 0 or more and the lower limit of its CrI is below 0.5; or if the SMD point estimate is less than 0 and the upper limit of its CrI is above 0.5.
- (3) Inconsistency: We rated two concepts, heterogeneity and incoherence (inconsistency), in this domain.

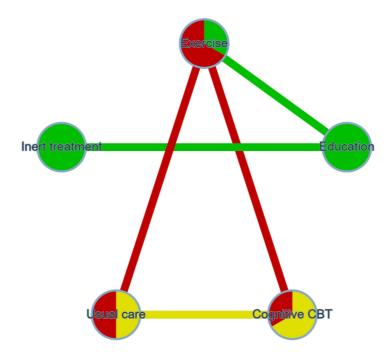

For heterogeneity, we looked at the common tau and found that it is low compared to the expected value as reported in the literature, <sup>29</sup> so we did not downgrade any network estimate for heterogeneity. For inconsistency, we looked at the results of side splitting and we downgraded the comparisons with important inconsistency (p<0.10), where we have not downgraded for imprecision (we did not downgrade the same network estimate for both imprecision and inconsistency).

- (4) Indirectness: We have assured transitivity in our network by limiting the included studies to acute and subacute population and to non-mixed treatments for LBP. Thus, we did not downgrade for indirectness.
- (5) Reporting bias: We cannot completely rule out the possibility that some studies are still missing. However, we assumed that publication bias was undetected.

## 1) Disability at 12 months

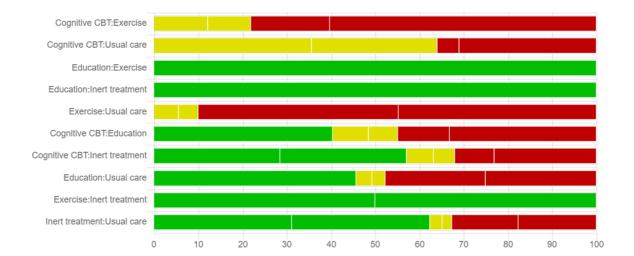

#### 1- Summary of study limitations of the included studies

The colours in the circles indicate the percentage of low RoB studies [green], moderate RoB studies [yellow] and high RoB studies [red] involving each intervention. The colours of the line then indicate the average RoB assessment of each comparison based on the above information – low RoB comparison [green], moderate RoB comparison [yellow] and high RoB comparison [red].

#### 2-Contribution of low or moderate RoB comparisons to each network estimate

Based on the above assessment of RoB for each comparison and the contribution matrix detailing contribution of each direct comparison to all network estimates, the following bar graphs show the percentage of low or moderate RoB contributions for each network estimate. The judgements about study limitations in each direct comparison is shown at the beginning of the graph. Each bar corresponds to a NMA relative treatment effect and shows how much information comes from comparisons at low [green] and high risk of bias [high].

### 3-Summary grading of Evidence

|                         | Number     | Within-study |                |              |             |               |             | Confidence |
|-------------------------|------------|--------------|----------------|--------------|-------------|---------------|-------------|------------|
| Comparison              | of studies | bias         | Reporting bias | Indirectness | Imprecision | Heterogeneity | Incoherence | rating     |

## Supplement R. Data check

We checked the dataset for data extraction errors or "outlier effect sizes" having an influence on overall effects. We defined an "outlier effect sizes" of a study, visually inspecting forest plots of pairwise meta-analyses<sup>30</sup>, when SMDs are greater than 1.5 <sup>31 32</sup> assuming 2 points of between population standard deviations across comparisons (resulting from the mean estimate of all final SD values in the control groups <sup>33 34</sup>, see row dataset in OSF repository <a href="https://osf.io/sjr4y">https://osf.io/sjr4y</a> for 0-10 NRS scale). This calculation is coherent with literature where the MID between group difference is commonly set at 1 point (2 SD) on a NRS scale of 0-10 <sup>35</sup>. Coherently, in the Nice Guideline for Low Back Pain and Sciatica<sup>36</sup> the panel considered clinical important an improvement of 10% as a measure of clinical benefit e.g. 1 point decrease on a 0-10 scale for pain intensity <sup>35</sup>.
